

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. MEASURES, WEIGHTS, & MONEYS

OF ALL NATIONS

AND AN ANALYSIS OF THE CHRISTIAN, HEBREW,
AND MAHOMETAN CALENDARS

BY W. S. B. WOOLHOUSE, F.R.A.S., F.S.S., ETC.

SIXTH EDITION, CAREFULLY REVISED AND ENLARGED

LONDON
CROSBY LOCKWOOD AND CO.
7, STATIONERS' HALL COURT, LUDGATE HILL
1881

232. 1. 389.

PREFACE.

THE measures, weights, and moneys established throughout the world are so diversified in their comparative values and systematic relations that a correct classification of them is a task of greater magnitude than would commonly be supposed. In the present work no labour has been spared to ascertain, in every case, the best attainable information, and the various details have been arranged with especial regard to facility of reference. With this object the materials appertaining to each locality are uniformly tabulated in the same order, and opposite to each separate quantity or value the English equivalent is distinctly exhibited, so as to obviate as much as possible the necessity of any calculation.

The comprehensive principles which influence the fluctuations of exchange are also briefly stated, and correct rules are given for computing the sterling value of coins and bullion.

The tables for the conversion of the standard linear and square measures of one country into those of another were before published in another form, and had recently become out of print. They are here enlarged and more conveniently arranged, and their utility will be fully appreciated by those who may have occasion to consult the architectural and other works of the Continent.

The second part of the volume relates to the measurement of time, and comprises a detailed investigation of the Christian, Hebrew, and Mahometan Calendars, with formulæ, tables, and practical rules for performing the various calculations. We have been more specially induced to go at length into these subjects, as they are imperfectly treated in chronological works generally.

PREFACE TO SIXTH EDITION.

THE Author, in preparing this sixth edition, has availed himself of the opportunity of making some important revisions and additions, some of which may be briefly mentioned.

During the last few years various foreign Governments have adopted the French metric system of measures and weights. These and other changes effected are noted in their proper places. As regards British standards, a sketch is given of the principal enactments of the Weights and Measures Act, which came into operation on the 1st of January, 1879. A detailed statement is also made of the collection of standards of various kinds in the custody of the Board of Trade, and a complete account is given of the laying down of the public standards of length at Trafalgar Square.

Additions and improvements have also been introduced in the later portion of the volume, which treats on measures of time. The processes and explanations are amplified. The table of the movable feasts, &c., has been conveniently arranged, so as to exhibit everything at one view, inclusive of ordinary and bissextile years. An account is given of the regulations of the law sittings according to the Judicature Act, which came into force on the 1st of November

1875; also of the law terms observed by the Inns of Court. A Table is also inserted showing the elements of the Gregorian Calendar for three centuries—namely, from the year 1800 to 2100 of the Christian era.

It is hoped that whatever utility the work has hitherto been found to possess will thus be considerably extended.

LONDON, *Nov.*, 1880.

STANDARDS.

MEASURES AND WEIGHTS.

MEASURES are of three kinds, viz. measures of LENGTH, called Linear or Long measure; measures of SURFACE, called Square or Superficial measure; and measures of CAPACITY, called Solid or Cubic measure.

WEIGHT may be defined to be the quantity of ponderous matter contained in a solid or fluid substance, taking into account its bulk and the density or specific gravity of its parts, and is determined by the same being balanced in an accurate scale against some known or acknowledged weights placed in the opposite scale.

STANDARDS are carefully-constructed measures or weights of acknowledged authority, by which others are tested or adjusted.

Measures and Weights are of indispensable utility, and are continually employed both in commercial and scientific pursuits. For the latter of these, minute accuracy is particularly essential. There is, however, more difficulty than would at first be supposed, in establishing and preserving correct, uniform, and invariable standards of weights and measures, and a vast amount of scientific research, ingenuity, and labour has been expended upon its accomplishment.

The origin of measures of length is to be found in parts of the human body. Their values, roughly estimated, as well as their names, establish this beyond a doubt. The foot, the digit, the palm, the span, the cubit, the nail, the arm, &c., are in all languages derived from the same source; and, in the popular view of measurement, they do not considerably differ in length. It is also unquestionable that in former times, when authenticated measures were not so easily to be obtained, the hands, arms, and feet were much more frequently used than they are at present, when every workman, however humble, is in possession of a measure.

Taking a well-proportioned man, the fathom is reckoned to equal his height or stature; the girth, or the pace, $\frac{1}{2}$ of his stature; the cubit, or measurement from the elbow to the ends of the extended fingers, $\frac{1}{4}$; the foot, $\frac{1}{3}$; the span, $\frac{1}{2}$; and the breadth of the palm, $\frac{1}{12}$.

The statute 17 Edward II. (A.D. 1324) provides that three barley-corns, round and dry, make an inch, 12 inches a foot, &c. But it is so difficult to know how much of the sharp end of a barley-corn must be cut or worn away before it becomes what was called "round," that this mode of measuring by the *lengths* of barley-corns is very indefinite.

The complete table of the sixteenth century is as follows:—The *breadth* of 4 barley-corns make a digit, or finger-breadth; 4 digits make a palm (measured across the middle joints of the fingers); 4 palms are a foot; $1\frac{1}{2}$ foot is a cubit; 10 palms or $2\frac{1}{2}$ feet are a step (grossus); 2 steps, or 5 feet, are a pace (passus); 10 feet are a perch; 125 paces are an Italic stadium; 8 stadia, or 1000 paces, are an Italic mile; 4 Italic miles are a German mile; and 5 Italic miles are a Swiss mile. From this table it would appear that the foot was considerably less even than the ancient Roman foot of 11.6 English inches; the average human foot certainly has not that length.

In the year 1742, the Royal Society had a standard yard ~~constructed~~, from a minute comparison of the standard ell

or yards of the reigns of Henry VII. and Elizabeth, kept at the Exchequer.

In the year 1758, a select Committee of the House of Commons was appointed to inquire into the state of English weights and measures, and were assisted in their researches by several eminent mechanists, among whom may be mentioned Mr. Bird, a celebrated optician, and Mr. Harris, the Assay Master of the Mint. This Committee prepared with great accuracy two standards, viz. the yard and the pound troy, which were afterwards carefully preserved and justly considered of the highest authority. The standard yard was copied from that of the Royal Society, and having been examined by the Committee was reported to be equal to the standard yard and marked as such.

Since that period no alteration has been made in these standards, though much attention has been paid to the subject, both in and out of Parliament, especially since the adoption of the metrical system of France.

In 1816, in consequence of an address from the House of Commons to the Prince Regent, his Royal Highness appointed a Commission, composed of Sir J. Banks, Sir G. Clerk, Davies Gilbert, Wollaston, Young, and Kater, to consider the subject of English weights and measures; to determine the length of the pendulum vibrating seconds in the latitude of London; and to settle the proportion between the long measures of England and France.

In the first Report, made in June, 1819, no alteration is proposed to be made in the English standards of long measure and of weight, those established by the Committee of 1758 having been found quite accurate.

The second Report, made in 1820, contains the final determination of the Commissioners on the standard of long measure, the length of the second's pendulum, and of that of the metre. The following are the concluding words of this decision:—

“We prefer the Parliamentary standard executed by 

Bird, in 1760, both as being laid down in the most accurate manner, and as the best agreeing with the most extensive comparisons, which have been hitherto executed by various observers, and circulated throughout Europe; and in particular with the scale employed by the late Sir George Shuckburgh.

“We have, therefore, now to propose that this standard be considered as the foundation of all legal weights and measures; and that it be declared that the length of the pendulum vibrating seconds in a vacuum, on the level of the sea, in London, is 39·1393 inches, and that of the French metre, 39·37079 inches, the English standards being employed at 62° of Fahrenheit.”

The third Report of the Royal Commission, made in 1821, contains a confirmation of the other two Reports, with respect to measures of length: and as to weights, the Parliamentary troy pound of 1758 is recommended to remain unaltered, and the pound avoirdupois to continue at 7000 troy grains. It is also announced, by new experiments, that a cubic inch of distilled water at 62° is 252·722 grains of the standard pound of 1758, when weighed in a vacuum.

The House of Commons again appointed a Committee in 1821, to which these Reports were submitted: this Committee agreed with the Commissioners, and a bill was introduced in 1823. A petition from the Chamber of Commerce at Glasgow to the House of Lords occasioned an investigation, when Dr. Kelly, as one of the witnesses before the Committee, called attention to certain difficulties and imperfections in the pendulum experiments, and expressed an opinion, supported by few others at the time, though now generally received, that “nature seems to refuse invariable standards; for, as science advances, difficulties are found to multiply, or at least they become more perceptible, and some appear insuperable.” The House of Lords adjourned the question over till 1824; when the act 5 Geo. IV. c. 74, was ~~passed~~ *passed*. This act came into operation on January 1, 1826,

and made no change in the lineal and superficial measures, nor did it alter either the troy or avoirdupois weights previously established; but the measures of capacity underwent considerable change. The old Ale, Wine, and Dry measures were formerly the three authorized measures of capacity. The old Wine gallon contained 231 cubic inches; the Corn gallon, 268·8; and the old Ale gallon, 282. These measures were altered to the Imperial Gallon, containing 277·274 cubic inches.

The act also states that the pendulum vibrating seconds of mean time in the latitude of London in a vacuum at the level of the sea is 39·1393 inches of the standard; and that the cubic inch of distilled water, weighed in air by brass weights, at 62° of Fahrenheit, the barometer being at 30 inches, is equal to 252·458 grains, according to the brass weight or troy pound of 1758, declared to remain the original and genuine standard measure of weight.

Under this system, a gallon of water weighing 70,000 grains, or 10 lbs., it follows that

“ A pint of pure water
Weighs a pound and a quarter ;”

where, of course, reference is made to imperial measures and the avoirdupois pound.

The Houses of Parliament were burnt in 1834, and it is remarkable that 5 and 6 Wm. IV. c. 63, which passed after the fire, takes no notice of the destruction of the standards, but refers to them as still in existence.

It was, however, fortunate that in the year 1832 the council of the Royal Astronomical Society caused a scale of one yard to be constructed for themselves, and obtained permission of the Speaker of the House of Commons to adjust and compare it with Bird's Imperial Standard of 1760. This was accomplished in 1834 by an extensive set of delicate experiments, ably conducted by Mr. Baily and Lieutenant Murphy (since deceased); and, after the subsequent loss of the Imperial Standard, it may now, perhaps, be

ferred to as the only measure of length from which the standard scale of Great Britain can be satisfactorily deduced. The Astronomical Society's scale was also compared with the Royal Society's scale of 1742, having two scales in it marked E and Exch.; a scale called Aubert's, the prototype of one which was used in the Indian survey by Lambton; one which had been used by Sir G. Shuckburgh; one belonging to the town of Aberdeen; one belonging to Mr. T. Jones; and four new ones made after the model of the Society's scale—one for the Danish government, one for the Russian government, one for Mr. Baily, and one retained for himself by Mr. Simms the constructor. The middle yard of the Astronomical Society's scale being taken as 36 inches, the various scales, according to the mean of many observations, were found to be as follows:—

Scale.	Standard Portion.	Mean Inches of Ast. Soc. Scale.
Astron. Society	Centre yard	36·000000
Danish	Ditto	35·999758
Russian	Ditto	36·000050
Simms's	Ditto	35·999903'
Baily's	Ditto	35·999949
Aberdeen	Ditto	35·998615
Jones's	Ditto	35·999802
Aubert's	0 in. — 36 in.	35·998447
Shuckburgh	0 in. — 36 in.	36·000185
Ditto	10 in. — 46 in.	35·999921
Royal Society	Line "E."	36·001473
Ditto	Line "Exch."	35·993684
Imperial standard of Bird's, of 1760, afterwards destroyed in 1834 by the burning of the Houses of Parliament		35·999624

Thus the Astronomical Society's standard being ·000376 longer than the Imperial standard, and the standard temperature being 62°, it follows that the length of the former standard, observed at 62°, and diminished by ·000376 of an inch, will give the true standard of the law.

In 1838, the Government appointed a Commis-

sion "to consider the steps to be taken for the Restoration of the Standards of Weight and Measure, which had been destroyed and lost by the burning of the Houses of Parliament." The members of this commission were Messrs. Airy, Baily, Bethune, Davies Gilbert, Herschel, Lefevre, Lubbock, Peacock, and Sheepshanks; and the following is extracted from their valuable report made in 1841:—

"We are of opinion that the definition contained in the act 5 Geo. IV. c. 74, ss. 1 and 4, by which the standard yard and pound are declared to be respectively a certain brass rod and a certain brass weight therein specified, is the best which it is possible to adopt.

"Since the passing of the said act, it has been ascertained that several elements of reduction of the pendulum experiments therein referred to, are doubtful or erroneous. Thus, the reduction to the level of the sea was doubtful, the reduction for the weight of air was erroneous, the specific gravity of the pendulum was erroneously stated, the faults of the agate plates introduced some degree of doubt, and sensible errors were introduced in the operation of comparing the length of the pendulum with Shuckburgh's scale, used as the representative of the legal standard. It is evident, therefore, that the course prescribed by the act would not necessarily reproduce the length of the original yard. It appears also, that the determination of the weight of a cubic inch of distilled water is yet doubtful, the greatest difference among the best English, French, Austrian, Swedish, and Russian determinations being about $\frac{1}{1200}$ of the whole weight, whereas the mere operation of weighing may be performed to the accuracy of $\frac{1}{1000000}$ of the whole weight.

"Several measures, however, exist, which were most accurately compared with the former standard yard (in particular the Royal Astronomical Society's Scale, described in their Memoirs, vol. ix., and the iron bars belonging to the Board of Ordnance, in the custody of Colonel Colby); and several *metallic weights* exist which were most accurately com-

with the former standard pound: and by the use of these the values of the original standards can be respectively restored without sensible error. And we are fully persuaded that, with reasonable precautions, it will always be possible to provide for the accurate restoration of standards, by means of material copies which have been carefully compared with them, more securely than by reference to any experiments referring to natural constants.

“From the evidence of persons best able to judge of the comparative use of troy weight and avoirdupois weight, the proportion does not exceed one set of troy weights to many thousand sets of avoirdupois. The statements of medical men and those of persons concerned in the trade of bullion, show that even to them the troy pound is useless. The avoirdupois pound, on the other hand, is universally known through this kingdom; and moreover, being now made equal to 7000 grains, it is well adapted to subdivision by the decimal scale,—an object which we think ought never to be placed out of view in considering the changes (in other respects producing no inconvenience) which may be made in the weights and measures of the country. We feel it our duty, therefore, to recommend that the *avoirdupois* pound be adopted instead of the *troy* pound as the standard of weight. With regard to the standard of length, we do not feel the necessity of proposing any change.

“That two modes of estimating weight should coexist, is undoubtedly an evil; its bad effects are greatly increased by the identity of the names used in the different scales for describing weights of very different values. Thus we have the *pound* in the avoirdupois scale, and the *pound* in the troy or apothecaries’ scale, the former being *greater* than the latter in the proportion of 7000 to 5760; we have the *ounce* in the avoirdupois scale, and the *ounce* in the troy or apothecaries’ scale, the former being *less* than the latter in the proportion of 7000 to 7680; we have the *dram* in the avoirdupois scale, and the *drachm* in the apothecaries’ scale, the

former being *less* than the latter in the proportion of 7000 to 15,360. In examining into the actual uses of these several denominations, we see at once that it is impossible to abrogate the avoirdupois pound and ounce, which are used so extensively by persons of every class, that they must be considered as being emphatically the British weights. The avoirdupois dram, however, does not appear to be used at all. The troy pound, as we have already mentioned, appears to be wholly useless : it is not used in contracts for gold and silver, or in medical prescriptions ; and we are not aware of any obstacle whatever to its entire abolition, except the existence of certain printed tables for the reduction of assays of the precious metals, in which the denominations of the larger weights are expressed by multiples of troy pounds. We propose, with the view of removing the confusion caused by the existence of this pound, and at the same time of respecting the private interests which (though to a very inconsiderable extent) are concerned in the change, that the Government should compute and print, for the use of bullion merchants and assayers, a new edition of these tables, in which the larger weights shall be expressed by decimal multiples of the troy ounce, to the entire exclusion of the troy pound. We are inclined to think that the troy ounce itself could not be abolished at present without some difficulty ; we think it right, however, that the persons using it should be imperatively required to describe it in such a manner that no confusion with the avoirdupois ounce can possibly occur. The remaining weights of the troy and apothecaries' scales may, for the present, be tolerated (for certain substances only), as leading to no ambiguity. Still we think it desirable, that measures should now be taken which may ultimately tend to the removal of the troy scale ; and remarking both the convenience of a decimal scale of subdivision of the avoirdupois pound, and the general willingness of bullion merchants to adopt a decimal scale, and remarking also, that by descending in *such a scale we arrive at a small weight (7 grains), bearing*

a simple relation to the grain on which the troy weight is based, we propose that the Government should use its influence for the introduction of such decimal scale.

"We beg leave to invite the attention of the Government to the advantage and the facility of establishing in this country a decimal system of coinage. In our opinion, no single change, which it is in the power of a Government to effect in our monetary system, would be felt by all classes as equally beneficial with this, when the temporary inconveniences attending the change had passed away. The facility consists in the ease of interposing between the sovereign (or pound) and the shilling, a new coin equivalent to two shillings (to be called by a distinctive name); of considering the farthing (which now passes as the $\frac{1}{960}$ th part of the pound) as the $\frac{1}{1000}$ th part of that unit; of establishing a coin of value equal to $\frac{1}{100}$ th part of the pound; and of circulating, besides the principal members of a decimal coinage, other coins of values bearing a simple relation to them, including coins of the same value as the present shilling and sixpence. We do not feel ourselves at liberty further to enter into this subject; but we have felt it imperative on us to advert to it, because no circumstance whatever would contribute so much to the introduction of decimal scale in weights and measures, in those respects in which it is really useful, as the establishment of a decimal coinage."

The report contains also the following recommendations:—
 "That the standard of length be defined by the whole length of a certain piece of metal or other durable substance, supported in a certain manner, at a certain temperature; or, by the distance between two points or lines engraved upon the surface of a certain piece of metal or other durable substance, supported in a certain manner, at a certain temperature: but that the standard be in no way defined by reference to any natural basis, such as the length of a degree of meridian on the earth's surface in an assigned latitude, or the length of the pendulum vibrating seconds in a specified place.

“That the length of the new Parliamentary standard be one yard; there appearing no sufficient reason for departing from the length hitherto adopted for the standard.

“That the name *milyard*, or some other to be fixed by act of Parliament, be recognized as describing the measure of 1000 yards, without the necessity of further definition.

“That the standard of weight be defined by a certain piece of metal or other durable substance.

“That the standard of capacity be defined by the capacity which, under certain circumstances of the barometer and thermometer, contains a certain weight of distilled water, but that it be in no way defined by reference to the standard of length. That, nevertheless, the contents of the standard of capacity, as expressed in units and fractions of the cubical measure dependent on the standard of length, be stated by way of recital, as the best determination made by scientific men which has come to the knowledge of the Legislature, and as permitted for use when it is impracticable to refer to trial by the weight of distilled water.

“That no standard of capacity be constructed; the definition of the gallon as ‘the capacity which contains 10 pounds’ weight of distilled water weighed in air at the temperature of 62° Fahrenheit, the barometer being at 30 inches,’ as specified in the act 5 Geo. IV., being still retained.

“That where it shall be impracticable to ascertain the contents of any vessel by the weight of distilled water which it contains, or by pouring water into it from a standard measure, it be permitted to ascertain the contents by gauging (the gallon being assumed to be 277·274 cubic inches), or by pouring seed into it from a standard measure.

“That a sufficient number of weights of multiples of grains be constructed (we would recommend 10 sets of 10, 100 and 1000 grains); and that their relative errors be found by comparison among themselves, and their absolute errors by comparison with the copies of the old troy pound of 578 grains.

“That by the use of these, a platinum weight of 7000 grains be constructed; and that this be declared the Parliamentary standard of weight, by the name of the pound weight; the distinctive word ‘avoirdupois’ being hereafter omitted.

“That the avoirdupois dram be no longer recognized in any contract.

“That the troy pound be no longer recognized; and that the word ‘pound,’ or any letters or symbols commonly used to denote the pound, as applied to a weight, be always interpreted to mean the pound of 7000 grains (formerly called the avoirdupois pound).

“That the word ‘ounce’ be always interpreted to mean $\frac{1}{16}$ th part of the pound, except it be described as the ‘troy ounce.’

“That the name *millet*, or some other to be fixed by act of Parliament, be recognized as describing the thousandth part of the pound, without the necessity of further definition.

“That the only legal weights above one pound, be weights of multiples of 1 pound not exceeding 10 pounds; and weights of 10 pounds and its multiples, not exceeding 100 pounds.

“That the name *centner*, or some other to be fixed by act of Parliament, be recognized as describing the weight of 100 pounds, without the necessity of further definition.

“That the Exchequer standards of weight be 1 lb. and several multiples thereof, not exceeding 10 lbs.; 10 lbs. and several multiples thereof, not exceeding 100 lbs.; 100 lbs.; but no weight of 14 lbs. or any multiple of 14 lbs. except 70 lbs. Also the tenth, hundredth, and thousandth part of the pound, and several multiples of them. Also 1 troy ounce, 10 troy ounces, 100 troy ounces, and several multiples of each; 1000 troy ounces; but no weight of 12 troy ounces or any of its multiples (except those included in the decimal scale above described). Also 1 pennyweight, and several multiples of it. Also 1 grain, 10 grains, 100 grains, 1000 *grains*, 10,000 grains, and several multiples of each.

"That the Exchequer standards of weight be used in the trial of weights brought for examination in the same manner as at present; and that no greater error than $\frac{1}{100000}$ th part of the quantity weighed be tolerated.

"We would recommend that the influence of the Government be employed to introduce the use of the decimal subdivisions of the acre; of which the first step is actually given by the square land-chain, and the others are contained in the numerical expression obtained in the first multiplication for finding the area of a piece of ground.

"Before leaving the subject of length-measures, we beg strongly to call the attention of Government to the importance of encouraging the use of the decimal scale, and especially of sanctioning its use where custom has already adopted it. We beg particularly to indicate the decimal subdivision of the foot (which is even now engraved on foot rules and levelling staves), as one extensively used in the practice of engineers, and one which we would recommend for the recognition of Government in every case."

Although the preceding recommendations of the Commission have not been carried out they are here inserted, as the subject is very important and worthy of being generally understood.

It is probable that the varieties of gallons arose from the varieties of pounds, since the original definition of the gallon depended upon the pound, and there is a close relation not only between the old gallons and the weights, but even between the different versions of the old gallons and the weights. There was a gallon of 282 cubic inches in the Exchequer as a standard; there was one of $272\frac{1}{4}$ inches in common use; there was one of 231 inches in common use; and there was one of 224 inches in the Guildhall. Now 282 and 232 are, as near as integers can represent it, in the proportion of the pound avoirdupois to the pound troy; and $272\frac{1}{4}$ and 224 are as nearly in the same proportion. It is unlikely that this should have been ~~as~~

The imperial weights and measures now in use are fixed by the act 5 Geo. IV. c. 74, of which the following is an abstract.

Abstract of an Act of Parliament, 5 Geo. IV. c. 74, passed June 17, 1824, "for ascertaining and establishing Uniformity of Weights and Measures," which came into operation on the 1st of January, 1826.

This is an act declaratory of the accuracy and legality of the existing standards, both of long measure and weight; but it orders the abolition of all measures of capacity for wine, ale, corn, coals, &c., and the establishment of one only in their stead, which is to be called "Imperial Measure."

1. The standard yard is declared to be the distance between the centres of the two points on the gold studs in the straight brass rod now in the custody of the Clerk of the House of Commons, whereon is engraved "Standard Yard, 1760," the brass being at the temperature of 62° by Fahrenheit's thermometer. It is to be called "the Imperial Standard Yard."

2. The dimensions for measuring land are unaltered: they are the statute measure, of which the acre contains 4840 square yards.

3. The yard, if lost, defaced, or otherwise injured, may be restored by comparing it with the pendulum vibrating seconds of mean time, in the latitude of London, in a vacuum on the level of the sea, the yard being in the proportion of 36 inches to 39·1393 of the pendulum.

4. The standard pound is declared to be the standard brass weight of one pound troy weight made in the year 1758, and now in the custody of the Clerk of the House of Commons, and it is denominated "the Imperial Troy Pound."

5. *If the imperial pound be lost, defaced, or otherwise*

injured, it shall be restored by comparison with a cubic inch of distilled water, weighed in air by brass weights, at the temperature of 62° of Fahrenheit's thermometer, the barometer being at 30 inches. Such cubic inch of water is equal to 252·458 grains, the standard troy pound being 5760 such grains; and the avoirdupois pound 7000 such grains troy. All operations of restoring or correcting standards are to be made under the directions of the Lord High Treasurer, or the Commissioners of His Majesty's Treasury, or any three of them for the time being.

6. The standard measure of capacity, as well for liquids as for dry goods, not measured by heaped * measure, shall be the gallon, containing 10 lbs. avoirdupois weight of distilled water, weighed in air at the temperature of 62° of Fahrenheit's thermometer, the barometer being at 30 inches; and such brass measure shall be "the Imperial Standard Gallon," and is declared to be the unit and only standard measure of capacity from which all other measures of capacity for all sorts of liquids, as well as for dry goods not measured by heaped * measure, shall be derived; and that all measures shall be taken in parts and multiples, the quart, pint, peck, bushel, and quarter continuing in the same proportion as heretofore for dry measure.

7. That the standard measure of capacity for coals, culm, lime, fish, potatoes, or fruit, and all other goods and things commonly sold by heaped * measure, shall be the imperial bushel, containing 80 lbs. avoirdupois of water as aforesaid; the same being made round, with a plain and even bottom, and being 19½ inches from outside to outside.

8. That coals and other goods sold by heaped * measure shall be duly heaped up in the said bushel in the form of a cone, such cone to be of the height of at least 6 inches; and the outside of the bushel to be the extremity of the base of

* Heaped measures have been abolished since 1st Jan. 1835 (4, 5, and 6 Will. IV. c. 49 and 63).

such cone; and that three bushels shall be a sack, and twelve such sacks a chaldron.

9. That for articles not sold by heaped * measure, such as corn, pulse, &c., the same shall be stricken with a round stick or roller, straight, and of the same diameter from end to end.

10. That this law of imperial measure is not to extend to Ireland for any articles hitherto sold by weight.

11. That copies and models of the standard of length, weight, and measure aforesaid, are to be made and verified within three months after passing the act, under the direction of the Lords of the Treasury; and that such copies or models shall be deposited in the office of the Chamberlain of the Exchequer at Westminster; and that copies shall be sent to the Lord Mayor of London, and the Chief Magistrate of Edinburgh and of Dublin, and to such other places or persons as the Lord High Treasurer or Commissioners of the Treasury may from time to time direct.

12. That His Majesty's justices of the peace, in every county of the British Empire, or every town or place, being a county within itself, shall, within six months after passing the act, purchase a model of each of the standards aforesaid, with their parts and multiples; and that such shall be compared and verified with the models deposited at the Exchequer, on payment of the usual fees; and that such verified copies shall be placed for custody and inspection with such persons as the magistrates shall choose to appoint; and that the same shall be produced by the keepers thereof, upon reasonable notice, the persons requiring such production paying the customary charges for the same.

13. The expenses of procuring models for magistrates, counties, &c., are to be raised by the usual modes of taxation.

14. That when reference cannot be easily had to verified copies of the standard measures of capacity, it may be lawful for any justice of the peace, or magistrate having jurisdiction, to ascertain the content of a measure of capacity, by direct

reference to the weight of pure or rain water which such measure is capable of containing ; 10 lbs. avoirdupois weight of such water, at the temperature of 62° by Fahrenheit's thermometer, being the standard gallon ascertained by the act, the same being in bulk equal to 277·274 cubic inches.

15. That all contracts for sale, &c., by weight or measure, shall be according to the imperial standard, when no special agreement shall be made to the contrary ; and in all cases where any special agreement shall be made, with reference to any weight or measure established by local custom, the proportion which every such local weight or measure shall bear to any of the said standard weights and measures, shall be expressly declared and specified, or otherwise such agreement shall be null and void.

16. That existing measures may be used, being marked so as to show the proportions which they have to the imperial measures ; but that after the 1st of May, 1825, no person shall be permitted to make any weights or measures, otherwise than according to the provisions of the new act.

17. That for ascertaining rents, &c., payable in grain or malt in England or Ireland, the amount is to be ascertained according to the standard by this act established, by a jury of 12 substantial freeholders.

18. That for ascertaining rents, &c., payable in grain or malt in Scotland, such rents shall be determined according to the new standard, by such juries as strike the *fiar* prices of grain.

19. That tables of equalization shall be made and constructed under the Commissioners of the Treasury, showing the proportions between the weights and measures heretofore in use and those now established.

20. That tables shall be also constructed for the collection of the customs and excise, under the direction of the said Commissioners of the Treasury.

21. *The present act may be enforced in Englan*

of all the regulations and penalties in
the Statute, except such parts of the sa-
me as are amended or altered by this present
Act, shall remain in force (L. vi. 17) 33 Geo. III. c.

17. And whereas the interest in Ireland
of the said Statute is the following

And whereas the said Statute is amended
and altered by the said Act, we are re-

quired by the said Act to amend the said

Statute in the following manner, to wit:

That the said Statute be amended by

the following provisions, to wit:

That the said Statute be amended by

the following provisions, to wit:

That the said Statute be amended by

the following provisions, to wit:

That the said Statute be amended by

the following provisions, to wit:

That the said Statute be amended by

the following provisions, to wit:

That the said Statute be amended by

the following provisions, to wit:

That the said Statute be amended by

the following provisions, to wit:

That the said Statute be amended by

the following provisions, to wit:

That the said Statute be amended by

the following provisions, to wit:

That the said Statute be amended by

the following provisions, to wit:

That the said Statute be amended by

the following provisions, to wit:

That the said Statute be amended by

the following provisions, to wit:

That the said Statute be amended by

the following provisions, to wit:

That the said Statute be amended by

the following provisions, to wit:

Scotland by all the regulations and penalties contained in the following statutes, except such parts of the said statutes as may be repealed or altered by this present act, viz. 29 Geo. II. c. 25; 31 Geo. II. c. 17; 35 Geo. III. c. 102; 55 Geo. III. c. 43.

22. The present act may be enforced in Ireland by all the regulations and penalties contained in the following statutes, except such parts of the said statutes as are repealed or altered by this act, viz. 4 Anne (*I.*); 11 Geo. II. (*I.*); 25 Geo. II. (*I.*); 27 Geo. III. (*I.*); 28 Geo. III. (*I.*)

23. The repeal of numerous laws is declared in this article; some of uncertain date before the reign of Edward the Third, and many since that period. These are chiefly statutes which fixed the weight and measure of certain kinds of goods, such as wool, cheese, salt, wine, beer, fish, fruit, &c.; and also the denominations which determine their quantity, as the sack, wey, load, tun, hogshead, barrel, &c. For the particulars of these statutes (which are now repealed either wholly or in part), recourse must be had to the originals, as referred to in the margin of the present act, and which amount to about 60 statutes.

24. That this act shall not extend to affect or alter the rights of the Dean and High Steward of Westminster, to appoint proper officers to sign and seal all weights and measures used in the said city and the liberties thereof.

25. That gaugeable liquors brought into the port of the city of London shall be gauged as heretofore by the Lord Mayor or his deputies; but the contents shall be ascertained by the standard measure directed by this act.

26. This act shall not extend to prohibit or diminish the right of the Lord Mayor and Commonalty of the city of London, concerning the office of gauger of any gaugeable liquors imported within the city of London, or the liberties thereof.

Numerical relations appertaining to the foregoing Act for equalizing Measures.

Weight of a cubic inch of distilled water, in a vacuum at the temperature $62^{\circ} = 252.722$ grains.

Consequently, a cubic foot = 62.3862 lbs. avoirdupois.

Weight of a cubic inch of distilled water in air at 62° of temperature with a mean height of the barometer = 252.458 grains.

Consequently, a cubic foot = 62.3206 lbs. avoirdupois.

And an ounce of water = 1.73298 cubic inches.

Cubic inches in the imperial gallon = 277.274.

Diameter of the cylinder, containing a gallon at one inch in depth = 18.78933 inches.

Specific Gravity of Water at different temperatures, that at 62° being taken as unity.

70° 0.99913	61° 1.00010	52° 1.00076	43° 1.00109
69 0.99925	60 1.00019	51 1.00082	42 1.00111
68 0.99936	59 1.00027	50 1.00087	41 1.00112
67 0.99947	58 1.00035	49 1.00091	40 1.00113
66 0.99958	57 1.00043	48 1.00095	39 1.00113
65 0.99969	56 1.00050	47 1.00099	38 1.00113
64 0.99980	55 1.00057	46 1.00102	37 1.00112
63 0.99990	54 1.00064	45 1.00105	36 1.00111
62 1.00000	53 1.00070	44 1.00107	35 1.00109

The difference of temperatures between 62° and 39° , where water attains its greatest density, will vary the bulk of a gallon of water rather less than the third of a cubic inch.

And assuming from the mean of numerous estimates the expansion of brass 0.00001044 for each degree of Fahrenheit's thermometer, the difference of temperatures from 62° to 39° will vary the content of a brass gallon measure just one-fifth of a cubic inch.

It appears that the specific gravity of clear water from the Thames exceeds that of distilled water at the mean tem-

perature, in the proportion of 1·0006 to 1, making a difference of about one-sixth of a cubic inch on a gallon.

Rain water does not differ from distilled water, so as to require any allowance for common purposes.

Comparisons of Old and New Measures.

The foregoing calculation of the diameter of a cylinder, which contains 1 gallon for every inch in depth, will be found useful in constructing both corn and coal bushels on the new plan of imperial measure.

Thus the corn bushel, with the diameter 18·78933, and 8 inches deep, will answer to 2218·192 cubic inches, the imperial bushel; being about $\frac{1}{3\frac{1}{2}}$ part more than the Winchester bushel, which is 2150·42 cubic inches.

The new coal bushel, with the above diameter and depth, and heaped as directed in Art. 8, the rim being about $\frac{3}{8}$ of an inch thick, and the diameter $19\frac{1}{2}$ inches from outside to outside, will measure 2816·459 cubic inches, which is only $1\frac{1}{2}$ inch more than the present coal bushel, viz. 2814·9 cubic inches.

The proportion between the old and new wine measures is very nearly as 5 to 6. Thus 5 imperial gallons equal 6 wine gallons and about $\frac{1}{4500}$ of a gallon over.

The proportion between the old and new ale measures is about as 60 to 59.

The following table will show the relative contents more accurately, both in measure and in weight, the latter having been computed according to the principles stated in the act.

Table showing the Contents of the different Gallons, both in Measure and Weight.

	Cubic Inches.	Avoirdupois Weight.	Troy Weight.			
		lb. oz. dr.	lb.	oz.	dwt.	gr.
Imperial Gallon. . .	277·274	10 0 0	12	1	16	16
Corn Gallon . . .	268·8	9 10 $1\frac{1}{2}$	11	9	7	12
Wine Gallon . . .	231	8 5 $6\frac{1}{2}$	10	1	9	22
Ale Gallon : . .	282	10 2 $11\frac{1}{2}$	12	4	6	8

These results will be found useful in comparing different vessels where gauging cannot be relied on; and although they are computed according to the conditions of temperature, &c., as stated in Art. 6, yet the proportions will answer with sufficient correctness for all common purposes of business, with any kind of fresh water; but where great accuracy is required, it may be determined at any other temperature by means of the table given on page 19. Thus to find the weight of the wine gallon at 56° Fahrenheit, multiply its weight at 62° , viz. 8.3811 by 1.0005, and the result will be 8.3853, the required weight.

The reduction of the different measures may be easily computed by means of *factors* or multipliers, given in the following table:—

Table of Factors, for converting Old and New Measures.

	By Decimals.			By Fractions.		
	Corn Measure.	Wine Measure.	Ale Measure.	Corn Measure.	Wine Measure.	Ale Measure.
To convert Old Measures into New .	.96943	.83311	1.01704	$\frac{33}{34}$	$\frac{8}{9}$	$\frac{32}{33}$
To convert New Measures into Old .	1.03153	1.20032	.98324	$\frac{34}{33}$	$\frac{9}{8}$	$\frac{33}{32}$

EXAMPLE I.—Reduce 63 gallons wine measure to imperial measure.

$63 \times .83311 = 52.486$; or $63 \times \frac{8}{9} = 52\frac{1}{2}$ imperial gallons nearly.

EXAMPLE II.—Reduce 8 bushels imperial measure to Winchester measure.

$8 \times 1.03153 = 8.25224$; or $8 \times \frac{33}{32} = 8\frac{1}{4}$ Winchester bushels nearly.

It should be observed, that the computations by the frac-

tions are only approximative, but they will be found sufficiently correct for most purposes.

In 1870 the Standards Commission, in connection with the Standard Weights and Measures Department of the Board of Trade, made the following important recommendation in their Fourth Report:—

“That mural or public standards of length be securely fixed for public use in all populous towns, and the expenses connected with them be defrayed from the local funds. The local authorities to be responsible for keeping them in good order, and the local inspectors to report to them periodically on their condition. These public standards not to be valid for convictions of false or defective measures.”

In pursuance of this recommendation, measures of 100 feet, and of the chain of 66 feet, with their subdivisions, were laid down on the north side of Trafalgar Square, and these were legalised as secondary standards of length by Her Majesty's Order in Council, dated 27th June, 1876, wherein it is pointed out that by the 1st section of “The Standards of Weights, Measures, and Coinage Act, 1866,” the custody of the imperial standards of length and of weight, &c., was transferred to the Board of Trade. The following condensed account, appertaining to the laying down of these secondary standards, has been extracted from an Appendix to the Annual Report, 1875-76, of H. W. Chisholm, Warden of the Standards.

The exhibition of public and mural standards of length in populous places throughout the country, was considered by the Commission for Restoration of the Standards to be one of the best auxiliary means for attaining and maintaining uniformity in the measures of length used by the public, and was recommended by the Commission in their Reports of 1841 and 1854. Similar recommendations were made by the Standards Commission appointed in 1867; and the mode in which they proposed such recommendations should *be carried out by the Standards Department in laying down*

public standards of the chains of 100 feet and of 66 feet, and erecting public standards of the yard and its principal parts.

In selecting a site for such public standards, the Commission expressed their opinion that they should be placed—

Where they are easily accessible to the public who may wish to compare their measures ;

Where such comparisons may be made without being disturbed by passers or idle gazers ;

Where sufficient protection from wilful damage may at all times be secured ;

And where there is a long and level plot of ground upon which the longer standard measures may be laid down, with an adjacent wall for the mural standards.

It was not until the spring of 1875 that the site of the north side of Trafalgar Square was obtained from the Office of Works, through the intervention of the Astronomer Royal. A working plan for the construction of these public standards was laid before the Standards Commission by the Astronomer Royal, which had been prepared by his son, Mr. Wilfrid Airy, an able practical civil engineer, whose valuable services were retained for making the working drawings, as well as for superintending the work of constructing the platform and laying down the standards. Mr. W. Airy also gave his assistance to the officers of the Standards Department in the work of comparing the standard chains when laid down, and in superintending the subsequent adjustment of some of the bronze blocks on which the defining lines were cut. All the blocks for defining the several measures are of bronze. Those inlaid in the granite are slightly conical, and are secured by cement in somewhat larger conical holes in the granite. The mural standard measures are also of bronze, securely fastened by screws to a solid frame. This frame, and those containing the descriptive tablets, are of bronze, and are secured to the granite wall by screws, the heads of which *have since been removed to the level of the adjoining met*

The mode in which the metal blocks bearing the defining lines of the standard measure of 100 feet were laid down, was by first marking out the several lengths by means of 10 of the pine 10-foot measuring-rods of the Standards Department, having subdivisions of 1 foot each marked upon them. Square holes were next cut in the granite in a marked-out straight line to receive the metal blocks, and were made sufficiently large to admit of a slight adjustment of the blocks in the direction of the length of the measure. When all was prepared, the square metal blocks for the 100-foot chain were placed in the several holes, and were embedded in cement, being secured on each side by an iron wedge. Each length was then carefully measured with the pine measuring-rods, and every requisite adjustment made, after which the surface of the cement was levelled and finished off.

A similar course was pursued with the whole length of the 66-foot chain, and with half of the whole length, the measurements being made with six of the 10-foot pine measuring-rods, and with two of the similar 3-foot measuring-rods of the Standards Department. The intermediate lengths of 10 links, each 7.92 inches, were laid down by using two 10-link measuring-rods of Messrs. Troughton & Simms, the intervals of each half-chain being adjusted so as to be as nearly equal as possible.

The definitive comparisons of the two measures of length were made with the two standard 10-foot measuring-bars, and the 6-foot bar constructed expressly for verifying continuous length measurements of this kind.

The errors of these two standard bars at 62° Fahr. have been determined, as follows:—

Standard 10-foot end-bar No. 1	.	.	.	·006739 in excess.
" " " No. 2	.	.	.	·005919 "
The two bars	.	.	.	·012658 "
And 100 feet measured with them	.	.	.	·063290 "

The standard 6-foot steel end-bar is similar in its construc-

tion to the two 10-foot standard bars. Its standard length at 62° F. has been determined to be .00691 inch in excess.

The mean results of two series of minute comparisons may be taken as the determined standard length at 62° F. of the several 10-foot subdivisions of the standard 100-foot measure from the zero block, viz. :—

Ascertained Errors of the several 10-foot Subdivisions of the Standard 100-foot Measure from the Zero Block, measured to the middle of the defining line :—

0—10 feet — .007 inch.	0—60 feet + .007 inch.
20 " — .019 "	70 " + .011 "
30 " — .022 "	80 " + .021 "
40 " — .015 "	90 " + .017 "
50 " — .008 "	100 " — .008 "

All these errors are within the breadth of the several defining lines.

The surveyors' chain of 66 feet is divided into 100 links, each being 7.92 inches in length. The standard 66 feet now laid down is divided into 10 lengths of 10 links each. The only practical mode of verifying all these lengths was to compare the whole distance of 66 feet with the standard 10-foot steel bars carried successively along it for 60 feet, and completing the measurement with the standard 6-foot bar. The mean result of two series of minute observations may be taken as the determined standard length, viz.—

Ascertained error of standard chain of 66 feet at 62° F. = — .019 inch.

A comparison was also made of each of the 10-link divisions of the 66-foot chain, with the two pine measuring-rods of 10 links each of Mr. Simms, in order to test any relative difference between them, and in this manner to verify the length of each, with reference to the relation of the sum of the 10 links to the whole length of the 66-foot chain. It was thus ascertained that the whole distance of 66 feet was accurately divided into 10 equal parts of 10 links each, within half the breadth of the defining lines.

The several mural standards of length, consisting of bed measures of the imperial yard of 3 feet, of 2 feet, of 1 foot, and of the line divisions of these measures, including those of 1 inch divided into tenths, have been accurately compared, and found to have no sensible error at the normal temperature of 62° F.

In France the new Metric System of measures, now completely established, was introduced in 1799, and is called metrical, as derived from the measurement of the earth. Its fundamental measure, the *metre*, is presumed to be the ten-millionth part of a meridian line drawn from the pole to the equator, and is 39·37079 English inches. Taking the one-hundredth of the metre, we obtain the *centimetre*; and for the standard of weight the *gramme* is a cubic centimetre of distilled water at the temperature of maximum density, the same being ·0022054 of an English avoirdupois pound, or 15·498 English grains. All the multiples and subdivisions of the current coins, as well as of every measure and weight, are decimal, full details of which will be found under the article "France." The advantage of such a system, when once established, is so great, that all who are capable of appreciating its merits look forward with interest to the introduction of a similar one into Great Britain. It has already been adopted in Austria, Belgium, Greece, Holland, Germany, Italy, Norway, Portugal, Spain, Sweden, and Switzerland.

The Weights and Measures Act, 1878 (41 & 42 Vict. cap. 49), came into operation on the 1st of January, 1879. By it all previous Acts are for the most part repealed. It is enacted,—

That the Board of Trade shall have all such powers and perform all such duties relative to standards of measure and weight, and to weights and measures, as are by any Act or *otherwise vested in or imposed on the Treasury, or the*

Comptroller-General of the Exchequer, or the Warden of the Standards. It shall be the duty of the Board of Trade to conduct all such comparisons, verifications, and other operations with reference to standards of measure and weight, in aid of scientific researches, or otherwise, as the Board of Trade from time to time thinks expedient, and to make from time to time a report to Parliament on their proceedings and business under this Act.

The Board of Trade shall cause to be compared with the Board of Trade standards all copies of any of those standards which are submitted for the purpose by any local authority, and have been used, or are intended to be used, as local standards, and, if approved, shall cause them to be stamped as verified in such manner as to show the date of such verification.

A contract or dealing shall not be invalid on the ground that the weights or measures used therein are weights or measures of the metric system, or on the ground that decimal subdivisions of imperial weights and measures, whether metric or otherwise, are used.

The Board of Trade also possess accurate copies of metric standards, and may, if they think fit, cause to be compared with the metric standards in their custody, and verified, all metric weights and measures, which are submitted to them for the purpose, and are of such construction as may be from time to time directed, and which the Board of Trade are satisfied are intended to be used for the purpose of science or of manufacture, and not for the purpose of trade within the meaning of this Act.

The following is a list of the standards in the custody of the Board of Trade at the passing of this Act :—

Measures of Length.

Feet: 100, 66, $16\frac{1}{2}$, 10, 6, 5, 4, 3, 2, 1.

And 1 inch divided into $\left\{ \begin{array}{l} 12 \text{ duodecimal} \\ 10 \text{ decimal} \\ 16 \text{ binary} \end{array} \right\} \text{equal parts.}$

Measures of Capacity.

Bushel, half-bushel, peck,
 Gallon, half-gallon,
 Quart, pint, half-pint,
 Gill, half-gill, quarter-gill.

Measures used in the Sale of Drugs.

Fluid ounces : 4, 3, 2, 1.
 „ drachms : 4, 3, 2, 1.
 Minims : 30, 20, 10, 5, 4, 3, 2, 1.

Avoirdupois Weights.

Pounds : 56, 28, 14, 7, 4, 2, 1. Ounces : 8, 4, 2, 1.
 Drams : 8, 4, 2, 1, $\frac{1}{2}$. Grains : 240, 120, 72, 48, 24.

Troy Bullion Weights.

Ounces : 500, 400, 300, 200, 100, 50, 40, 30, 20, 10, 5, 4, 3, 2, 1.
 Decimals : $\cdot 5$, $\cdot 4$, $\cdot 3$, $\cdot 2$, $\cdot 1$, $\cdot 05$, $\cdot 04$, $\cdot 03$, $\cdot 02$, $\cdot 01$, $\cdot 005$, $\cdot 004$, $\cdot 003$,
 $\cdot 002$, $\cdot 001$.

Decimal Grain Weights.

Grains : 4,000, 2,000, 1,000, 500, 300, 200, 100, 50, 30, 20, 10, 5, 3,
 2, 1, $\cdot 5$, $\cdot 3$, $\cdot 2$, $\cdot 1$, $\cdot 05$, $\cdot 03$, $\cdot 02$, $\cdot 01$.

Metric Measures and Weights.

1. Length. Metres : 2, 1, $\cdot 1$, $\cdot 01$, $\cdot 001$.
2. Weights. Kilograms : 20, 10, 5, 2, 1.
 Grams : 500, 200, 100, 50, 20, 10, 5, 2, 1.
 Decigrams : 5, 2, 1. Milligrams : 5, 2, 1, $\cdot 05$.
3. Capacity. Litres : 20, 10, 5, 2, 1, $\cdot 5$, $\cdot 2$, $\cdot 1$, $\cdot 05$, $\cdot 02$, $\cdot 01$, $\cdot 005$,
 $\cdot 002$, $\cdot 001$.

COINS.

Coins are pieces of metal, mostly of a round and flat shape, stamped by authority with certain impressions, which are intended to give them a legal and current value, and also to serve as a guarantee for their weight and fineness.

Gold and silver are the principal metals of which coins are made, being found the fittest for that purpose, both on account of their qualities and their scarcity.

Copper and billon are likewise used, but always for coins of inferior value.

The proportional value of gold and silver is variable ; for

although they are generally considered as equivalents of other property, and standard measures of value by which commodities are bought, sold, and estimated, yet, being themselves also saleable articles, they are liable to constant fluctuation in price, as exchanged for each other, as well as with respect to all property.

Pure gold and silver are invariable in their qualities, from whatever mines they are produced. In their fine state they are considered too flexible to make coins fit for general wear; and hence the practice of mixing with them a certain proportion of harder metal, which is called *alloy*.

The coinage of William the Conqueror was after the plan established by Charlemagne, in France, in the eighth century, and is supposed to be derived from the Romans, with respect to dividing the pound into 20 shillings and the shilling into 12 pence.

The Saxon pound weight was adopted by King William, and was called the moneyer's pound; and from it 20 shillings were coined, which made $21\frac{1}{4}$ to the pound troy. This number was increased in succeeding reigns until the year 1665 (18th Charles II.), at which time it was settled at 62 shillings, and so continued until the year 1816, when it was altered to 66 shillings, its present rate.

In the early coinages the silver penny or sterling was minted with a deep cross. When it was broken into two parts, each was called a *halfpenny*, and when into four, each part was called a *fourth-thing*, or farthing. Larger silver pieces of fourpence were also coined, which were called *greats*, or *groats*, and also *grosses*. There were besides, silver halfpence and farthings minted; but no shillings until the reign of Henry VII. (1504), nor copper coins until the reign of Charles II. (1665.)

As to gold coins, the first after the Norman Conquest, according to Snelling, was struck by order of Henry III. in the year 1257. It weighed two silver pence, passed for *twenty pence*, and was called the *gold pennie*. The same

author observes, "that the king tried this expedient of coining gold through necessity, and that the city of London made a representation against this measure."

The next gold coinage in England was in the year 1344, when the florin was struck, which took its name from *Florence*, where it had been first minted in 1252. It was afterwards coined in most countries of Europe. In Germany and Holland it was called the *guilder*, on account of its having been originally gold. The florin, however, has been long a silver coin, and also a money of account.

The above coins are supposed to have been of pure gold; but those minted in the subsequent reigns down to that of Henry VIII. were 23 carats $3\frac{1}{4}$ grains fine, with $\frac{1}{2}$ grain of alloy. This was called the old standard to distinguish it from the new or the present standard, which was first called *crown gold*, as being minted into crown pieces in 1527.

The principal gold coins of the old standard were nobles of 6s. 8d. each, with halves and quarters: the latter were called *farthing nobles*. There were also marks of 13s. 4d., angels of 10 shillings, and sovereigns of 20 shillings each. Sovereigns were first minted by Henry VII., and were frequently altered during the four subsequent reigns; but in the 2nd of James I. they were fixed at 22 carats, at which fineness all gold coins have since been minted. The 20 shilling pieces first coined at this rate were called *unites*, and $33\frac{1}{3}$ pieces were struck from the pound troy; but in the reign of Charles II. (1666) a new coinage of $44\frac{1}{2}$ to the lb. was minted, and these were called *guineas*, on account of the country from which the gold was originally brought. The guinea varied in its current price from 20 shillings up to 30, until the year 1717, when, by the recommendation of Sir Isaac Newton, it was fixed at 21 shillings, its present rate.

The system of both metals being standard measures of *value*, which they were in virtue of each being a legal tender

to any amount, was the source of much disorder; for as their market prices were always subject to variation, one kind of coin had a constant tendency to drive the other out of circulation.

To remedy this great inconvenience, our present monetary system was established in 1816, at which time, as gold was the metal in which the principal payments were made in England, the following law was enacted:—"That gold coins shall be in future the sole standard measure of value, and legal tender of payment, without any limitation of amount, and that silver coins shall be a legal tender for the limited amount of forty shillings only, at any one time."

In the same year a new coinage of 20 shilling pieces, called *sovereigns*, was minted, in due proportion to the guinea, viz. $46\frac{2}{3}$ sovereigns to the pound troy; and an extensive silver coinage also took place, at the new rate of 66 instead of 62 shillings to the troy pound, which affords a profit or *seignorage* of $6\frac{1}{4}$ per cent., but its actual amount must always depend on the market price of the metal.

The total existing quantity of gold when compared with that of silver is estimated to be nearly as 1 to 50, and the relative value of gold to silver is as about 16 to 1; consequently the value of the general silver currency of the world as compared with the gold currency is about 3 to 1. In Great Britain however, gold being the only legal tender for sums above forty shillings, the metallic currency is essentially gold, and the silver and copper coins are only introduced as auxiliary tokens for the purpose of effecting the fractional and smaller payments. The circulation of silver coin, about 13,000,000*l.* sterling including our colonies, is therefore of inconsiderable amount when compared with that of other countries.

The following table, extracted from Kelly's Universal Cambist, exhibits the history of English coins in a condensed form. It should be observed that the last column is calculated according to the Mint proportions which overrate the *metallic value of silver*.

Table showing the Alterations English Coins have undergone with respect to Weight and Fineness, and also the Comparative Value of Gold and Silver, from the Reign of WILLIAM THE CONQUEROR to that of GEORGE IV.

1821	2 George IV.	—	3 6 0	—	46 14 6	1 — 14-287	...

By the above table it appears that silver coins have been diminished in value, during the last 500 years, in the ratio of 99 to 32, and gold coins nearly as 3½ to 1.

In all regular governments, there has been a standard for coins fixed by law; that is, a certain proportion between the quantity of pure metal and its alloy. Thus, the established legal standard for gold in England is $\frac{23}{24}$ or $\frac{11}{12}$; that is, eleven parts of pure metal, and one of alloy. The fineness of gold is generally expressed in carats; the whole weight being supposed to be divided into 24 equal parts or

carats, 22 of which are of pure metal and 2 of alloy: and hence, the English standard gold is said to be 22 carats fine; and the carat is divided into 4 parts, called grains: but these proportions differ in other countries. Experiments have shown that the proportions of the British gold standard give the combination of the two metals' which possesses the greatest degree of hardness.

The carat is the 24th part of the pound troy, or 10 pennyweights; and therefore the carat grain is $2\frac{1}{2}$ pennyweights or 60 grains.

The English standard for silver is $\frac{925}{1000}$ or $\frac{37}{40}$; it is ex-

¹ Wrought gold has two legal standards; one is 22 carats, the same as the coin, and the other is 18 carats. The latter commenced in 1798, and is used chiefly in the manufacture of watch-cases and rings.

Wrought silver has also two legal standards; one the same as the coin, and the other 8 dwts. better, that is 11 oz. 10 dwts. The latter, called new-sterling, is seldom used.

All articles manufactured of gold and silver, except watch-cases, have to be taken to the Assay Office of the district, and if found of legal quality are stamped thus:—

The Hall Mark, showing the district where manufactured, or the hall where assayed, is at *Birmingham*, an anchor; *Chester*, three wheatsheaves, or a dagger; *Dublin*, a harp or figure of Hibernia; *Edinburgh*, a thistle, or castle and lion; *Exeter*, a castle with two wings; *Glasgow*, a tree, and a salmon with a ring in its mouth; *LONDON*, a leopard's head; *Newcastle-on-Tyne*, three castles; *Sheffield*, a crown; *York*, five lions and a cross.

The Standard Mark for gold of 22 carats, and silver of 11 oz. 2 dwts., is for England a lion passant; for Edinburgh, a thistle; for Glasgow, a lion rampant; for Ireland, a harp crowned. Gold of 18 carats fine, a crown and the figures 18. Silver of the new standard, figure of Britannia.

The Duty Mark is the head of the Sovereign, and indicates the duty has been paid.

The Date Mark is a letter of the alphabet, which is changed every year; it differs however in different companies. The Goldsmiths' company of London have used the following: from 1716 to 1755, Roman capital letters; 1756 to 1775, small Roman letters; 1776 to 1795, old English letters; 1796 to 1815, Roman capital letters, A to U; 1816 to 1835, small Roman letters a to u; 1836 to 1855, old English letters a to h. In 1856 a new Date Mark will be issued. (I and J are always regarded as letters.)

pressed in troy ounces and pennyweights, that is, 11 oz. 2 dwt. of pure, and 18 dwt. of alloy, making together 1 pound troy.

The alloy of silver is mostly copper, and that of gold both silver and copper; but in the computation of coins the alloy is never reckoned of any value, being always allowed in order to save the trouble and expense that would be incurred in refining the metals to their highest degree of purity.

Besides this standard fineness of coins, there is also a legal weight fixed according to the mint regulation or rate of coinage of each country. Thus, in England a pound troy of standard gold is coined into $44\frac{1}{4}$ guineas, or $46\frac{2}{3}$ sovereigns, and a pound of standard silver into 66 shillings, with divisions and multiples in proportion; and hence, the mint price of standard gold is 3*l.* 17*s.* $10\frac{1}{2}$ *d.* per ounce, and that of standard silver, 66 pence per ounce. Before the year 1816, silver was coined at the rate of 62 pence per ounce; and this is sometimes reckoned the standard price in the valuation of foreign silver coins.

Copper money is coined in the proportion of 24 pence to the pound avoirdupois. Thus the penny should weigh $10\frac{2}{3}$ drams or $291\frac{2}{3}$ grains, and the other pieces in proportion.

Silver coin is a legal tender for the limited amount of 40 shillings; and copper to the amount of 12 pence.

According to the mint regulations of most countries, there is an allowance for deviation from the standard weight and fineness of coins, which is called the *remedy of the mint*. In some places the remedy is allowed in the weight, in others in the fineness; but mostly in both weight and fineness. It is considered generally as an allowance for the fallibility of workmanship. In some mints, however, it is made a source of emolument; and where governments issue coins at a rate above their intrinsic value, or the market price of the metal, the profit thus made is called *seignorage*, and charges for mint expenses are called *brassage*.

The *remedy of the mint*, according to the law of 1815, for gold coins is 12 grains per lb. in the weight, and $\frac{1}{16}$ of a

carat in the fineness ; and for silver coins 1 dwt. per lb. in the weight, and the same in the fineness. The remedy for copper coins is $\frac{1}{16}$ of the weight.

The following tables exhibit the British imperial standard weights and fineness of the various coins ; those marked † are not now in ordinary circulation :—

British Gold Coins.

British Bronze Coins.

An avoirdupois pound of copper was formerly coined into twenty-four pence, or forty-eight halfpence, or ninety-six farthings. In 1860 these were replaced by a bronze coinage, of less weight, composed of ninety-five parts of copper, †

of tin, and one of zinc. A pound of bronze (7,000 grains) is coined into forty-eight pence, or eighty halfpence, or one hundred and sixty farthings.

The halfpence measure exactly an inch in diameter, so that, in case of emergency, twelve of them placed in a line might be used as a substitute for a foot-rule.

These bronze coins are also available as convenient letter-weights, observing that

3 pence	} go to the ounce.
5 halfpence	
or 10 farthings	

The silver coins in circulation are considered only as tokens, payable by the government, and pass for more than their metallic value as compared with gold. Precaution is taken that it shall not be worth while to melt the silver coin into bullion, and it is so nearly worth its current value that imitation would not be ventured on so small a profit. The government will always receive back its tokens however worn they may be, provided they be not wilfully defaced or fraudulently reduced. But gold, being the sole standard measure of value, and legal tender of payment, circulates as a commodity; and hence the necessity of government receiving it at value on its return to the mint, and making a deduction for loss of weight when the same exceeds the remedy of the mint. The wear and tear of the gold coinage is such, that very nearly 3 per cent. of the whole circulation goes out annually; and the quantity which will suffice to throw a sovereign out of circulation is about one-fourth of a grain.

In 1853 a Select Committee was appointed to take into consideration, and report to Parliament, the practicability and advantages, or otherwise, that would arise from adopting a decimal system of coinage. The practical substance of the Report is conveyed in the following extracts.

“The first question to be decided is, what shall be the unit of the new system of coinage; and your Committee *have no hesitation* in recommending the present pound *ring*. *Considering that the pound is the present standard,*

and therefore associated with all our ideas of money value, and that it is the basis on which all our exchange transactions with the whole world rest, it appears to your Committee that any alteration of it would lead to infinite complication and embarrassment in our commercial dealings; in addition to which it fortunately happens, that its retention would afford the means of introducing the decimal system with the minimum of change. Its tenth part already exists in the shape of the florin or two-shilling piece, while an alteration of four per cent. in the present farthing will serve to convert that coin into the lowest step of the decimal scale which it is necessary to represent by means of an actual coin, viz. the thousandth part of a pound. To this lowest denomination your Committee propose, in order to mark its relation to the unit of value, to give the name of mil. The addition of a coin to be called a cent., of the value of 10 mils, and equal to the hundredth part of the pound, or the tenth part of the florin, would serve to complete the list of coins necessary to represent the monies of account, which would accordingly be pounds, florins, cents, and mils.

“As respects the coins, it will be necessary to withdraw from circulation certain of the coins at present in use, and to substitute in their place other coins, having reference to the decimal scale, before the decimal system can be considered as fully developed. Your Committee contemplate the retention under any circumstances, of the present sovereign (1000 mils), half-sovereign (500 mils), florin (100 mils), and shilling (50 mils, or 5 cents). The present sixpence, under the denomination of 25 mils, might be retained, and the crown, or piece of 250 mils, of which few are in circulation, need not be withdrawn. On the other hand, it will be desirable to withdraw the halfcrown, and the threepenny and fourpenny pieces, which are inconsistent with the decimal scale.

“With regard to the coins not in actual existence, but which it will be necessary eventually to introduce, it appears to your Committee, from the evidence taken by them on ⁴

subject, that copper coins of 1, 2, and 5 mils, and silver coins of 20 and 10 mils, will be required, to which should be added such others as experience may show to be desirable. It is important, however, to bear in mind, that the smaller the number of the coins with which it is practicable to effect purchases and exchanges, the better.

“Your Committee recommend that all the silver coins hereafter coined should have their value in mils marked upon them, in order that the public might, at the earliest possible period, associate the idea of the system with their different pecuniary transactions. They further recommend that all the copper coins that may be issued under the decimal system, should also have their value in mils similarly marked upon them. They believe that the necessary inconvenience attending a transition state will be far more than compensated by the great and permanent benefits which the change will confer upon the Public of this country, and of which the advantages will be participated in to a still greater extent by future generations.”

Such is the decimal system of coinage recommended by the Committee, after having taken voluminous evidence upon the subject, and we must here accord to the report our full and unreserved approval, not only as regards the general principle, but in all its details. It must eventually be adopted, and it is indeed convenient that so little modification in existing coins will be requisite to bring it into practical operation. The radical coins in circulation will be pounds, florins, cents, and mils; but it will not be absolutely essential to treat them as separate moneys of account. There will be no necessity to employ any other denominations in accounts than the pound and mil—that is, the pound and its decimals. For further details on this subject we must refer to Dr. Bowring's treatise on “The Decimal System,” which also contains well-executed wood-cut illustrations of English, French, Greek, and Roman coins, and an elaborate and interesting chapter on the numerals of different nations.

COMPUTATION OF COINS AND BULLION.

The value of bullion, or of a gold or silver coin, depends entirely upon the quantity of pure metal which, by a process called its assay, it is found to contain. The alloy which enters into its composition, is not estimated in the value, being always disregarded, and allowed as a compensation for the expense of refining.

Assays of gold are weighed in carats and carat grains, the carat being a nominal weight containing 4 carat grains. The carat weight is usually considered to be the 24th part of the pound troy = 10 dwts. = 240 grains troy; according to which the carat grain = 60 grains troy. It is not, however, requisite to give to it any fixed or absolute weight, as it is only used to determine the proportions of pure metal and alloy.

Assays of silver are weighed in ounces and pennyweights, the ounce being a nominal weight containing 20 pennyweights, and so far these weights are analogous to the troy table.

The British standard of gold is 22 carats fine; that is to say, 24 carats weight of the metal should contain just 22 carats of fine or pure gold, the same being $\frac{11}{12}$ of the total weight¹.

The British standard of silver is 11 oz. 2 dwts. fine; that is, 12 oz. weight of the metal should contain just 11 oz. 2 dwts. of fine or pure silver, being $\frac{22}{24}$ or $\frac{11}{12}$ of the total weight¹.

The reports of English assayers are made after comparing the ascertained weights with these standards, the difference being usually called the betterness or worseness of the metal, as the case may be. Thus gold found to be 23 carats 2 grains fine, is reported "better 1 carat 2 grains;" and gold of 20 carats 2 grains is reported "worse 1 carat 2 grains." Also pure silver, 12 oz. fine, would be reported

¹ The British standards are also the mintage standards of the gold and silver coins of the realm.

"better 18 dwts.;" and silver ascertained to be 9 oz. 14 dwts. fine would be reported "worse 1 oz. 8 dwts."

Gold. Let w denote the total weight of a piece of gold or gold coin, expressed in troy grains; and g the number of carat grains in the fineness of the metal, as obtained from the assay report.

Then, as the British standard of fineness contains 88 carat grains, the proportion of standard gold contained in the metal is expressed by the fraction $\frac{g}{88}$. Consequently the actual weight, in troy grains, of standard gold contained in the piece = $\frac{wg}{88}$.

The same, in troy ounces, = $\frac{wg}{88} \times \frac{1}{480} = \frac{wg}{42240}$.

Now, the Mint value of a troy ounce of standard gold is 3*l.* 17*s.* 10½*d.*, which, expressed in fractions of the pound sterling, = $\frac{623}{160}$.

Therefore the value of the piece of gold or coin, expressed in pounds sterling =

$$\frac{wg}{88} \times \frac{1}{480} \times \frac{623}{160} = \frac{6 \cdot 23}{67584} wg = \frac{wg}{10848}.$$

The same, in shillings sterling, = $\frac{10wg}{5424} = \frac{059}{32} wg$.

From the preceding the following practical rules are deduced:

(1.) From an assay report on gold metal to find the *fineness*.

Rule. Put down 22 carats and the report underneath it: add the report if "better," or subtract it if "worse," and the sum or difference will be the "carats fine."

(2.) From an assay report and the weight of a piece of gold, or gold coin, to find the quantity of *fine* or *pure* gold it contains.

■ *Rule.* Find the fineness by (1), and reduce the same to

carat grains at the rate of 4 grains to the carat. Multiply the full weight of the metal by this number of carat grains, and divide by 96. The result will be the "fine weight."

(3.) To find the quantity of *standard* gold contained in the piece.

Rule. Proceed as in (2); only divide by 88 instead of 96, and the result will be the "standard weight."

Otherwise, multiply the weight of the piece by the number of carat grains in the assay report, "better or worse;" divide by 88, and add the quotient to the full weight, if "better," or subtract it if "worse."

(4.) To find the *value* of a piece of gold, or gold coin, in sterling money.

Rule. From the assay report determine the fineness by (1); reduce it at the rate of 4 grains to the carat, and multiply the number so found into the total weight of the metal, or coin, expressed in troy grains. Then divide the product by 10848, and the result will be the required value expressed in pounds sterling; or, otherwise, multiply the product by 59, divide by 4 and by 8, and finally cut off three decimals, and the result will be the required value expressed in shillings sterling.

The value, in shillings sterling, of a piece of gold, or gold coin, may be otherwise obtained from the calculated number of grains of fine gold it contains, by multiplying the same by .177.

Silver. Let w be the weight of a piece of silver, or silver coin, expressed in troy grains; p the number of penny-weights contained in its degree of fineness.

Then, as the British standard of fineness contains 222 dwts., the proportion of standard silver is $\frac{p}{222}$, and the actual quantity of standard silver, in troy grains, = $\frac{wp}{222}$.

The same in troy ounces = $\frac{wp}{222} \times \frac{1}{480} = \frac{wp}{106560}$.

Thus, taking ¹ 5*s.* or 60*d.* as the value of a troy ounce of standard silver, the value of the piece of silver or coin, expressed in pence sterling =

$$\frac{wp}{222} \times \frac{1}{480} \times 60 = \frac{wp}{1776}.$$

Hence the following practical rules for computations of silver:—

(1.) From an assay report on silver metal to find the *fineness*.

Rule. Put down 11 oz. 2 dwts., and the report underneath it; add the report if “better,” or subtract it if “worse,” and the sum or difference will be the “fineness.”

(2.) From an assay report and the weight of a piece of silver, or silver coin, to find the quantity of *fine* or *pure* silver it contains.

Rule. Find the fineness by (1), and reduce the same to dwts., at the rate of 20 dwts. to the ounce. Multiply the full weight of the metal by this number of dwts., and divide by 240, and the quotient will be the “fine weight” required.

(3.) To find the quantity of *standard* silver.

Rule. Proceed as in (2); only divide by 222 instead of 240, and the result will be the “standard weight.”

Otherwise, multiply the weight of the piece by the number of dwts. in the assay report, “better” or “worse:” divide by 222, and add the quotient to the full weight, if “better,” or subtract it if “worse.”

(4.) To find the *value* of a piece of silver, or silver coin.

Rule. From the assay report ascertain the fineness by (1); reduce it to dwts., at the rate of 20 dwts. to the ounce, and multiply the number so found into the total weight of the metal, or coin, expressed in troy grains. Divide the product by 1776 (or, if preferred, by 4, 4, and 111), and

¹ The Mint price of standard silver, which was formerly 62*d.*, is now 60*d.* per ounce; but this is above the average market value, which is considered to be about 60*d.*, the price now usually adopted in the valuation of coins.

the result will be the required value expressed in pence sterling.

The value in pence sterling may be also obtained from the calculated number of grains of pure silver, by multiplying the same by 10, and then dividing by 74; or it may be obtained from the number of grains of standard weight, by simply dividing by 8.

Note.—In France and Holland assays are made on the decimal system, the *proportion* of fine metal estimated in thousandth parts of the whole weight being called *MILLIÈMES*. By some assay calculators the same proportion put down in hundredth parts, which, of course, expresses the pure metal as a per centage, is called the *TOUCH*.

Both the Bank and the Mint now receive decimal reports, which are both simple and convenient, and will ultimately supersede the unnecessary cumbrous system of carats and carat grains.

To calculate the fine weight from a decimal report it is only requisite to multiply the total weight by the *millièmes* and then to point off three decimals.

To obtain the value of coin from the fine weight :—

$$\left. \begin{array}{l} \text{Silver} \\ \text{Gold} \\ \text{,,} \end{array} \right\} \text{fine grains} \times \left\{ \begin{array}{l} \frac{19}{24} \\ 0.177 \end{array} \right\} = \text{value in } \left\{ \begin{array}{l} \text{pence} \\ \text{,,} \\ \text{shillings} \end{array} \right\} \text{sterling.}$$

For bullion :—

$$\left. \begin{array}{l} \text{Silver} \\ \text{Gold} \end{array} \right\} \text{fine ounces} \times \left\{ \begin{array}{l} \frac{19}{44} \\ 4\frac{1}{4} \end{array} \right\} = \text{value in pounds sterling.}$$

With the gold, if worth while, deduct 1*d.* for every 8*l.* of value from this last calculation.

To show by actual examples the practical application of the foregoing rules, the several calculations have been made with respect to various coins, and the results of these calculations are exhibited in the last four columns of the following table. These results are determined from the data given in the two preceding columns, viz. the Assay and the W—

GENERAL PRINCIPLES OF EXCHANGE.

A Bill of Exchange is a written order addressed by one person to another, directing the latter to pay on account of the former to some third person, or his order, or to the order of the person drawing the bill, a certain sum of money at a time therein specified. It is a mercantile contract, in which four persons are mostly concerned, viz. :—

The *drawer* and *seller* of the bill, who receives the value.

The *drawee*, his debtor, upon whom the bill is drawn. He is called the *acceptor*, when he writes his acceptance across the bill, and thereby engages to pay it when it becomes due.

The *payee*, or person to whom it is ordered to be paid, and who may, by indorsement, pass it to any other person.

The *buyer*, who gives value for the bill. Mercantile payments are, for the most part, made in bills of exchange, which generally pass from hand to hand, like any other circulating medium, until due. The person who at any time has a bill in his possession is called the *holder*, the payee being the holder in the first instance. When the holder of a bill disposes of it, he writes his name on the back, which is called *indorsing*. Any person may indorse a bill, and every indorser, as well as the acceptor or payee, is a security for the bill, and liable to be sued for payment.

Some bills are drawn at sight; others at a certain number of days, or months, after date, or after sight, and some at *usance*, which is meant to express the customary or usual term between different places. Days of grace are a certain number of days granted to the acceptor or payee, after the term of the bill is expired.

Inland exchange is the remittance of bills to places in the same country, by which means debts are discharged more conveniently than by cash remittances. Thus reciprocal debts, of equal amount, due between persons in ~~the~~

parts of the country, may be discharged without remitting specie, and such an operation is recommended by general convenience; but when the debts are unequal, the debtor place must pay its balance, either by transmitting cash or bills; and as the latter mode is generally preferred, an increased demand for bills must be the consequence, which enhances their price, as it would that of any other article of sale or purchase.

This is the principle of exchange, and it is exemplified in the premium paid for inland bills on London. The metropolis is the grand emporium of commerce that supplies other places in the kingdom with foreign merchandise, and being also the seat of government to which the revenue is transmitted, and the residence of wealthy landlords, whose rents must be remitted to them from the country, it has generally a large balance of debt in its favour; and as this balance is chiefly paid in bills, a demand for them is created, and a premium is the consequence. The premium on inland bills is generally commuted for time; that is, for a certain number of days after date, or after sight, which date, or term, varies according to the demand and other circumstances.

Foreign exchange is essentially the same as that of inland, with respect to settling accounts by a transfer of claims, and also by the premium or price of bills being regulated by the proportion between the demand and the supply; but the mode of paying the premium for foreign bills is different, and the operation of adjustment is more complicated, owing to the introduction of the comparative values of different moneys, since different countries have different coins, different in denomination, in weight, and consequently in value.

In foreign exchange, one place always gives another a fixed sum, or piece, of money for a variable price, expressed by other coins; the former is called the *certain price*, and *the latter the uncertain price*. Thus London is said to

give to Paris the certain for the uncertain when the pound sterling is made exchangeable for a variable number of francs ; and to Spain the uncertain for the certain when a variable number of pence sterling is exchangeable for the dollar of exchange. The uncertain price, as quoted at any time, is called the *rate*, or *course of exchange*.

When the demand in London for bills on Paris is great, a less number of francs is given for the pound sterling, and *vice versâ*. Again, if the course of exchange between London and Paris be 25 francs for the pound sterling, and if this number of francs contains the same quantity of pure silver as 20 shillings sterling, then the exchange is considered at par ; but if Paris should give a higher price, the exchange is said to be against France, and in favour of England. This is the general mode of judging whether the exchange is favourable or unfavourable, though it is not always that on which merchants act or speculate:

The *intrinsic par* of exchange is the value of the money of one country compared with that of another, with respect both to weight and fineness according to accredited assays. It is, in effect, the metallic par ; for though the moneys of exchange are many of them imaginary, their value is always deducible from that of the coins they represent, or to which they have an established relation.

The *commercial par* is the comparative value of the moneys of different countries, according to the weight, fineness, and market prices of the metals.

Thus two sums of different countries are *intrinsically* at par when they *contain* an equal quantity of the same kind of pure metal ; and two sums of different countries are *commercially* at par when they can *purchase* an equal quantity of the same kind of pure metal.

The intrinsic par of exchange may be computed from gold or from silver coins. As a general rule, the measure of value should be of that metal in which the principal *payments are made* ; and, therefore, in some countries the

should be computed from gold, and in others from silver, according to the kind of money in which bills of exchange are paid. It is, however, obvious that the intrinsic par of exchange can be determined only between places which pay their bills in the same kind of metal. Even the same metal must differ considerably between two countries where one possesses mines, and supplies the other with materials of coinage, as between Spain and France, or between Portugal and England. The difference in all such cases is usually estimated according to the expenses of transporting the precious metals; and thus, from the intrinsic par and the various charges and prices, the commercial equivalence is computed.

The fluctuations of exchange are occasioned by various circumstances, both political and commercial. A greater or less demand for money in a stated place at a particular time may increase or diminish its commercial value without reference to its intrinsic value. The principal cause of fluctuation is generally stated to be the *balance of trade*, by which is meant the difference between the commercial exports and imports of one country with respect to another. The demand for bills of exchange arises out of the necessity of paying for importations. The supply arises out of the practice of drawing for the amount of exportations. If the supply and the demand be equal, if for every pound's worth of goods imported there be a pound's worth of exported goods to be drawn for, there will be no real exchange; that is, the real exchange, however much the nominal exchange may alter, will be at par. When, however, the importations are not equal to the exportations, exchange can no longer remain at par. An excess of importation would cause the exchange to advance against the importing country, and *vice versâ*. The exchange may, however, be unfavourable to a country when the balance of trade is greatly in its favour; for the demand for bills must chiefly depend on the balance of such debts as *come into immediate liquidation*, that is to say, on the

balance of payments. Besides, it does not follow that large exports are always successful, or quick in their returns ; and even should this be the case, the balance of payments may be still unfavourable from political causes, such as foreign loans, subsidies, expeditions, or colonial establishments.

When any legal changes take place in the coinage or currency of a country, the exchange will of course vary, so as to keep pace or correspond with such alterations. The same remark is applicable to the debasement of coin through clipping and wear. This, however, cannot in either case be considered as an absolute change in the price of bills, but only in the money or medium through which they are bought or sold.

In times of peace, the course of exchange seldom remains long unfavourable to a country, at least beyond the expenses that might be incurred by the transportation of the precious metals ; for bullion is considered the universal currency of merchants, and exchange gives it circulation, and thus tends to maintain the level of money throughout the commercial world. An unfavourable rate of exchange also operates as an encouragement to the exportation of goods, and as a check against the importation ; for the exporter can afford to sell the goods cheaper in proportion to the premium which he receives for his bill, while the discount on bills from abroad operates as a tax or duty on importation. Thus exchange has always, in ordinary times, a natural tendency to restore an equilibrium.

MEASURES, WEIGHTS, AND MONEYS.

For the purpose of easy reference amongst the extensive details contained under this head, the measures and weights of Great Britain, and the tables appertaining to them, are first enumerated and explained, and those of other countries are afterwards given according to the alphabetical order of the several places. The English equivalents are uniformly in relation to Imperial measures, and avoirdupois weights are always to be understood, unless otherwise stated. Troy grains and avoirdupois grains are identical in value, though the English grain has generally the former denomination, being originally derived from the standard troy pound. The names of places given at the top of the pages always refer to the contiguous matter immediately underneath them, this arrangement being considered the clearest for rapid reference.

GREAT BRITAIN.

The act, 5 Geo. IV. c. 74, for establishing uniformity of weights and measures, came into operation on the 1st of January, 1826. The measures of capacity are the only ones which it changed. The old wine gallon contained 231 cubic inches; the corn gallon, 268·8; and the old ale gallon, 282. These were altered to the uniform imperial gallon, containing 277·274 cubic inches. The imperial standards remain unaltered in the Weights and Measures Act, 1878, now in force.

Measures of Length.

3 barleycorns	make 1 inch.
12 inches	„ 1 foot (12 inches).
3 feet	„ 1 yard (36 inches).
5½ yards	„ 1 rod, pole or perch (5½ yards or 16½ feet).
4 poles or 100 links	„ 1 chain (22 yards or 66 feet).
10 chains	„ 1 furlong (220 yards or 660 feet).
8 furlongs	„ 1 mile (1760 yards or 5280 feet).

A line is the $\frac{1}{16}$ th part of an inch.

A nail is $2\frac{1}{4}$ inches (used in measuring cloth).

A palm is 3 inches.

A hand is 4 inches (used for measuring the height of horses).

A span is 9 inches.

A cubit is $1\frac{1}{2}$ foot.

A military pace is $2\frac{1}{2}$ feet.

An itinerary pace is 5 feet.

A Scotch ell is 37·06 inches } (used in measuring holland and other cloth).
An English ell is 45 inches }

A fathom is 2 yards or 6 feet (used in sounding depths).

A cable's length is 120 fathoms or 240 yards.

A league is 3 miles.

A degree of the equator is 69·1613 miles or 365172 feet.

A degree of the meridian is 69·046 miles or 364566 feet.

The old Scotch and Irish miles are $1\frac{1}{8}$ and $1\frac{3}{11}$ English.

Among ordinary mechanics, the inch is usually divided into eighths; but in scientific calculations it is mostly divided into decimals, or otherwise the foot is decimally divided.

Measures of Surface.

144 square inches	make 1 square foot.
9 square feet	„ 1 square yard.
$30\frac{1}{4}$ square yards	„ 1 pole, rod or perch ($30\frac{1}{4}$ square yards).
16 poles	„ 1 chain (484 square yards).
40 poles	„ 1 rood (1210 square yards).
4 roods, or 10 chains	„ 1 acre (4840 square yards).
640 acres	„ 1 square mile.

Measures of Capacity. 1. Dry Measure.

4 gills	make 1 pint	(34·659 cubic inches).
2 pints	„ 1 quart	(69·318 cubic inches).
4 quarts	„ 1 gallon	(277·274 cubic inches).
2 gallons	„ 1 peck	(2 gallons).
4 pecks	„ 1 bushel	(8 gallons).
4 bushels	„ 1 coomb	(4 bushels).
2 coombs	„ 1 quarter	(8 bushels).
5 quarters	„ 1 wey or load	(40 bushels).
2 weys	„ 1 last	(80 bushels or 10 quarters)

A pottle is 2 quarts or half a gallon.

A strike is 2 bushels.

A cubic foot is 1728 cubic inches.

A cubic yard is 27 cubic feet; which measure of earth is called a

2. *Wine and Spirit Measure.*

4 gills	make	1 pint	(34·659 cubic inches).
2 pints	„	1 quart	(69·318 cubic inches).
4 quarts	„	1 gallon	(277·274 cubic inches).
36 gallons	„	1 tierce	(36 gallons).
1½ tierces	„	1 hogshead	(54 gallons).
2 hogsheads	„	{ 1 pipe, butt, or puncheon }	(108 gallons).

The larger quantities, such as hogsheads, puncheons, &c. are gauged, and charged according to the actual contents.

3. *Ale, Beer, and Porter Measure.*

4 gills ¹	make	1 pint.	
2 pints	„	1 quart.	
4 quarts	„	1 gallon	(277·274 cubic inches).
9 gallons	„	1 firkin	(9 gallons).
2 firkins	„	1 kilderkin	(18 gallons).
2 kilderkins	„	1 barrel	(36 gallons).
3 kilderkins	„	1 hogshead	(54 gallons).
2 hogsheads	„	1 butt	(108 gallons).
2 butts	„	1 tun	(216 gallons).

To reduce cubic inches to bushels.

Rule. Multiply by 5, and divide by 11091.

To reduce cubic inches to gallons.

Rule. Multiply by 40, and divide by 11091.

WEIGHTS.

Troy Weight.

24 grains	make	1 pennyweight	(24 grains).
20 pennyweights	„	1 ounce	(480 grains).
12 ounces	„	1 pound	(5760 grains).

By troy weight gold, silver, jewels, and precious stones are weighed. Diamonds and pearls are an exception; they

¹ In London the gill is commonly called a “quartern;” in the North of England the gill is termed a “noggin,” and a half-pint is called a

are weighed by the carat, which contains 4 grains; but 5 diamond grains are only equal to 4 troy grains; the ounce troy containing 150 diamond carats.

The imperial standard pound troy, made in the year 1758, is that from which all other weights are obtained: $\frac{1}{12}$ th of it is the troy ounce; $\frac{1}{20}$ th of the ounce is a pennyweight; and $\frac{1}{24}$ th of the pennyweight is a grain; so that 5760 grains is a troy pound, and 7000 such grains is a pound avoirdupois, the grain in each case being identical.

Apothecaries' Weight.

20 grains	make	1 scruple	(20 grains)	sign $\mathfrak{z}$.
3 scruples	„	1 drachm	(60 grains)	sign $\mathfrak{z}$.
8 drachms	„	1 ounce	(480 grains)	sign $\mathfrak{z}$.
12 ounces	„	1 pound	(5760 grains)	sign lb .

Apothecaries compound their medicines by these weights, but buy and sell by avoirdupois.

The *pound*, *ounce*, and *grain*, are the same as in *troy* weight.

Apothecaries' Fluid Measure.

60 minims (m)	make	1 drachm	($f\ 3$).
8 drachms	„	1 ounce	($f\ \bar{3}$).
20 ounces	„	1 pint.	
8 pints	„	1 gallon.	

Avoirdupois Weight.

16 drams	make	1 ounce	(437 $\frac{1}{2}$ grains).
16 ounces	„	1 pound	(7000 grains).
14 pounds	„	1 stone	(14 lbs.).
2 stone	„	1 quarter	(28 lbs.).
4 quarters	„	1 hundred (cwt.)	(112 lbs.).
20 cwt.	„	1 ton	(2240 lbs.).

The new act, 1878, declares that “all articles sold by weight shall be by avoirdupois weight, except gold, silver, platinum, diamonds, and other precious metals or stones, and drugs when sold by retail; and that ~~such~~ sub ~~excepted~~ excepted articles, and none others, may be sold by

The stone formerly varied from 8 lb. to 16 lb. in different places; but by the act passed in 1834, the stone is to consist of 14 lb. avoirdupois, and the cwt. of 8 stone; and all contracts made by any other measure are null and void.

Hay and Straw.

36 pounds	make	1 truss of Straw.
56 pounds	"	1 truss of Old Hay.
60 pounds	"	1 truss of New Hay.
36 trusses	"	1 load.
18 cwt.	"	1 load of Old Hay.
19 cwt. 32 lbs.	"	1 load of New Hay.
11 cwt. 64 lbs.	"	1 load of Straw.
1 cubic yard of New Hay weighs 6 stone.		
1 ————— Oldish Hay	"	8 stone.
1 ————— Old Hay	"	9 stone.

Hay is considered as new for three months, and is called old on the 1st of September.

To find the weight of Hay contained in a Stack.—Multiply the length of the stack by its breadth, and multiply the result by its height, all in feet; divide the product by 27, which will give the number of cubic yards; this multiply by 6, 8, or 9, according to the age of the hay, as above, and the product will be the weight in stones. In measuring the height deduct two-thirds of the distance in feet from the eaves to the top.

Coal.

14 pounds	make	1 stone.
28 pounds	"	1 quarter cwt.
56 pounds	"	1 half cwt.
1 sack of 112 pounds	"	1 cwt.
1 double sack of 224 pounds	"	2 cwt.
20 cwt. or 10 large sacks	"	1 ton.
21 tons 4 cwt.	"	1 barge or keel.
20 keels, or 424 tons	"	1 ship load.
cwt. or 7 tons	"	1 room.

The Newcastle chaldron is a weight of 53 cwt.

By the 1st and 2nd of William IV., it is directed that all coals be sold by weight instead of measure; 10 sacks of 224lbs. each to one ton.

To calculate the weight of Cattle.—Measure round the animal close behind the shoulder, then along the back, from the fore part of the shoulder-blade to the bone at the tail. Multiply the square of the girt by five times the length, both expressed in feet. Divide the product by 21, and you have the weight of the four quarters, in stones of 14 lbs. In very fat cattle, the weight is about a twentieth more than that ascertained in this manner, while very lean ones weigh about a twentieth less. The quarters are little more than half the weight of the living animal. The skin weighs about the eighteenth, and the tallow about the twelfth of the whole.

Miscellaneous Liquid Measures.

Hogshead of Claret	46	gallons.
Butt of Sherry	108	„
Pipe of Port or Masden	115	„
Pipe of Madeira or Cape	92	„
Pipe of Teneriffe	100	„
Pipe of Lisbon or Bucellas	117	„
Butt of Tent, Malaga or Mountain	105	„
Aum of Hock, Moselle, and other German wines	30	„
Double aum of ditto	60	„
Pipe of Marsala or Bronti	93	„
Puncheon of Scotch Whisky	110 to 130	„
Puncheon of Brandy	110 to 120	„
Hogshead of Brandy	55 to 60	„
Puncheon of Rum	90 to 100	„

A hogshead is one-half
 A quarter cask is one-fourth
 An octave is one-eighth

} of a pipe, butt or puncheon.

Money Table.

4 farthings	make	1 penny	(4 farthings).
12 pence	"	1 shilling	(48 farthings).
20 shillings	"	{ 1 pound or sovereign }	(960 farthings).

Other coins in use:—

A half-sovereign is 10 shillings.

A crown is 5 shillings.

A half-crown is 2 shillings and 6 pence.

A florin is 2 shillings.

A sixpence or tester is 6 pence.

A fourpenny piece or groat is 4 pence.

A threepenny piece or bit is 3 pence.

A halfpenny is half a penny or 2 farthings.

Former coins now out of circulation:—

Moidore	.	.	.	27 shillings.
Jacobus	.	.	.	25 "
Carolus	.	.	.	23 "
Guinea	.	.	.	21 "
Mark	.	.	.	13 shillings and 4 pence.
Half-guinea	.	.	.	10 shillings and 6 pence.
Angel	.	.	.	10 shillings.
Seven shilling piece	.	.	.	7 shillings.
Noble	.	.	.	6 shillings and 8 pence.

Proposed Decimal Coinage.

(The mil = 0·24 penny = 0·96 farthing).

10 mils make 1 cent (2·4 pence).

10 cents " 1 florin (24 pence).

10 florins " 1 pound (240 pence).

The mil, cent, and their multiples are the only new coins required.

This simple and uniform system will soon be generally understood, and its advantages are obviously so great that it must eventually come into operation.

Scotland and Ireland. In all bill or money transactions relating to Scotland or Ireland, it is requisite to insert or ~~mention~~ the word *sterling*, to indicate that the established *values of England* are intended.

ABYSSINIA (AFRICA).

MEASURES.—The principal measure of length is the Turkish pic, which contains 26·8 English inches or 0·6804 metre of France.

The measure for grain is the ardeb :—

At Gondar, in the interior, the ardeb contains 10 madegas ;
 „ Massowah, on the Red Sea, „ „ 24 „ ;
 and about 80 madegas make an English imperial bushel.

Weight.—The weights are the dirhem or drachm, the wakea or ounce, and the rottolo or pound :—

ENGLISH VALUE.			
10 drachms	make	1 wakea	400 grains.
12 wakeas	„	1 rottolo or liter	4800 grains or 10 troy ounces.
12 drachms	„	1 mocha	480 grains or 1 oz. troy.

Money.—Coins of other countries are in circulation, amongst which may be mentioned Venetian sequins, Spanish dollars and imperial or Austrian dollars. The last are called patakas or patacks :—

23 harfs	make	1 pataka or dollar.	4s. 2d.
2½ patakas	„	1 sequin.	9s. 4½d.

Payments of large amount are usually made in ingots of gold, weighed by the wakea or Abyssinian ounce, containing 400 English grains. The pataka is also a money of account, of fluctuating value, and about 12 patakas are reckoned as the price of the wakea.

Aix-la-Chapelle; see Prussia.
 Aleppo (Syria); see Ottoman Asia.
 Alexandria; see Egypt.
 Algiers (Africa); see France.
 Alicante; see Spain.
 Altona; see Denmark.

ARABIA.

America; see United States.

Ancona; see Roman States.

Antwerp; see Belgium.

ARABIA.

Measures.—At Mocha the long measures are the guz (25 English inches) and the cobido or covid (19 inches). The baryd (4 farsakh) is 12 English miles.

Liquids.

		ENGLISH VALUE.
16 vakias	make 1 noosfia	$\frac{1}{4}$ imperial gallon.
8 noosfias	„ 1 gudda	2 „ gallons.

For dry measure, 40 mecmedas or kellas make the teman or tomand, which, in rice, weighs 168 lbs. avoirdupois.

Weights.

40 vakias	make 1 maund	3 lbs. avoirdupois.
10 maunds	„ 1 frazil	30 „ „
15 frazils	„ 1 bahar	450 „ „

Money.

80 caveers current make 1 piastre (3s. 5d. sterling).

Payments are however commonly made in Spanish dollars, valued at $1\frac{1}{2}$ piastre. The moneys coined in the country are commassees, which contain but little silver (only 7 carats), and pass at about 40 for the dollar, being used for small payments.

Archangel; see Russia.

Arragon; see Spain.

Athens; see Greece.

Augsburg; see Bavaria.

AUSTRIA : VIENNA.

Length.

ENGLISH VALUE.

12 punkte	make 1 linie	0·0864 inch.
12 linien	„ 1 zoll	1·0371 „
12 zoll	„ 1 fuss	12·445 inches or 1·0371 foot.
6 fuss	„ 1 klafter	6·2226 feet or 2·0742 yards.
4000 klafter	„ 1 meile	8297 yards or 4·7142 miles.

The elle is 30·66 English inches or 2·555 feet.

Surface.—A joch, or day's work, supposed to be as much ground as can be ploughed with one team in a day, is 1600 Vienna square klafters or fathoms = 6884 square yards or 1·4223 acre, and it is divided into 3 metzen.

Liquid Capacity.

2 pfiff	make 1 seidel	0·0779 imperial gallons.
2 seidel	„ 1 kanne	0·1557 „ „
2 kannen	„ 1 mass	0·3114 „ „
10 mass	„ 1 viertel	3·1143 „ „
4 viertel	„ 1 eimer	12·4572 „ „
32 eimer	„ 1 fuder	398·6304 „ „

Dry Capacity.

8 probmetzen	make 1 becher	0·0132 bushels.
4 becher	„ 1 futtermassel	0·0529 „
2 futtermassel	„ 1 muhlmassel	0·1057 „
2 muhlmassel	„ 1 achtel	0·2115 „
2 achtel	„ 1 viertel	0·4230 „
4 viertel	„ 1 metze	1·6918 „
30 metzen	„ 1 muth	50·7536 „ or 6·3442 quarter

Weight, Commercial.

4 pfennig	make 1 quentchen	67·5 grains or 0·0096 lb.
4 quentchen	„ 1 loth	270·2 „ 0·0386 „
2 loth	„ 1 unze	540·4 „ 0·0772 „
4 unzen	„ 1 vierding	2161·6 „ 0·3088 „
2 vierding	„ 1 mark	4323·2 „ 0·6176 „
2 mark	„ 1 pfund	8646·4 „ 1·2352 „

Weight, Apothecaries'.

			ENGLISH VALUE.	
20 gran	make 1 scrupel		22·52 grains or 0·0469 oz.	troy
3 scrupel	„ 1 drachme		67·55 „	0·1407 „
8 drachmen	„ 1 unze		540·4 „	1·1258 „
12 unzen	„ 1 pfund		6484·8 „	13·510 „

The mark (4333 grains) is the unit of gold and silver weight and the apothecaries' pound = $1\frac{1}{2}$ mark.

Money.

10 kreuzer piece		2·4 penny sterling.
100 new kreuzers make 1 gulden or florin		24 pence or two shillings.
2 gulden	„ 1 thaler or rixdollar	4 shillings.
The gold ducat		= 9s. 5d. sterling.
„ half-sovereign		= 13s. 11d. „

The standard of money is called 20 guldenfuss, as 20 gulden are coined from the Cologne mark of fine silver.

Since 1876 the only legal measures and weights are those of the metric system of France ; see p. 75.

See also Bohemia and Venetian Lombardy.

BADEN (GERMANY).

Length.

10 punkte make 1 linie		0·118 inches.
10 linien	„ 1 zoll	1·181 „
10 zoll	„ 1 fuss	11·811 „ or 0·9842 feet.
10 fuss	„ 1 ruthe	118·110 „ 9·8425 „

The ruthe is 3 French metres.

Surface.

100 square ruthen make 1 viertel		9688 square feet or 0·2224 acre.
4 viertel	„ 1 morgen	38752 „ „ 0·8896 „

Liquid Capacity.

10 glass make 1 mass		0·3301 gallons.
10 mass	„ 1 stütze	3·3014 „
10 stützen	„ 1 ohm	33·014 „
10 ohm	„ 1 fuder	330·140 „

The ohm is 15 French decalitres.

Dry Capacity.

ENGLISH VALUE.

10 becher	make 1 mässlein	0.0413 bushels.
10 mässlein	„ 1 sester	0.4127 „
10 sester	„ 1 malter	4.1268 „ or 0.5158 quarters.
10 malter	„ 1 zuber	41.2680 „ 5.1585 „

The malter is 15 French decalitres.

Weight.

10 ass	make 1 pfennig	7.7 grains.
10 pfennig	„ 1 centass	77.2 „
10 centass	„ 1 zehning	772 „ or 0.1103 lb.
10 zehning	„ 1 pfund	7720 „ 1.1029 „

The pfund is $\frac{1}{2}$ French kilogramme.

The mark of Cologne (3609 grains troy) is used for weighing gold and silver.

For apothecaries' weight, see Nürnberg.

For the new imperial measures, weights, and moneys, now in use, see Germany, page 78, and France, page 75.

Barbadoes; see West Indies.

Barcelona; see Spain.

Basle, or Bâle; see Switzerland.

Batavia; see Java.

BAVARIA.

Length.

The Bavarian	foot	11.42 inches or 0.9517 feet.
„	„ ell	32.796 „ 2.7330 „
„ Augsburg	foot	11.65 „ 0.9708 „
„	„ long ell	24.00 „ 2.0000 „
„	„ short ell	23.32 „ 1.9433 „
„ Nuremberg	foot	11.96 „ 0.9967 „
„	„ ell	26.00 „ 2.1667 „

Liquid Capacity.

The Bavarian	eimer	=	14.116 gallons.
„ Augsburg	mass	=	0.326 „
„	„ muid	=	15.080 „
„ Munich	eimer	=	8.122 „
„ Nuremberg	„ visirmass		14.963
„	„ „ schenkmass		13.964

Dry Capacity.

	ENGLISH VALUE.
The Bavarian scheffel	6·1172 bushels.
„ Augsburg „	12·087 „
„ „ „ (8 metzen)	5·650 „
„ Munich scheffel	9·976 „
„ Nuremberg malter	4·598 „

Weight.

The Bavarian	pound	8642 grains or 1·2346 lb.
„ Augsburg	mark	3643 „ 0·5204 „
„ „	heavy pound	7580 „ 1·0829 „
„ „	light „	7295 „ 1·0421 „
„ Munich	pound	8656 „ 1·2366 „
„ Nuremberg	mark	3670 „ 0·5243 „
„ „	pound	7870 „ 1·1243 „
„ „	old troy „	7360 „ 1·0514 „
„ „	apothecaries' „	5520 „ 0·7886 „

The Nuremberg apothecaries' pound is used for weighing medicines throughout Germany, and its subdivisions are the same as in England.—See Nürnberg.

Money (Austrian standard).

60 kreuzers	make 1 florin	2s. sterling.
The rixdollar	of 1800	4s. „
The florin of Nuremberg		20d. „

For the new imperial measures, weights, and moneys, now in use, see Germany, page 78.

BELGIUM.

The weights and measures are the same as those of France or Holland, though some of them are differently expressed, as aune for metre or ell, litron for litre or kan-nen, and livre for kilogramme or ponden.

Money.

100 centimes	make { 1 franc	9·4d. sterling.
	{ 1 florin	20d. „

The value of Belgian money in francs is the same as that in pence; and in florins, as well as the old Brabant money

in schillings and grotes, it is the same as that of Holland. In the division of the florin, the stiver is 5 cents, so that 20 stivers make the florin; and its value is about $2\frac{1}{3}$ francs.

Bengal; see East Indies.

Bergen; see Sweden and Norway.

Berlin; see Prussia.

Bermudas; see West Indies.

Berne; see Switzerland.

BIRMAH (ASIA) : RANGOON.

Length.

The paulgaut is 1 inch English.

The taim or cubit is 18 inches.

The saundaung or royal cubit is 22 inches.

The dha or bamboo is 7 royal cubits = 154 inches.

The dain or Birman league is 1000 dhas = 24306 miles.

Weight.

			ENGLISH VALUE.
100 ticals or	} make 1 vis		3½ lbs. avoirdupois.
3 catties			
150 vis			
	„ 1 candy	500 „ „	

The Birmans, like the Chinese, keep their accounts decimally, and have no coin. Silver bullion and lead are the currency of the country.

BOHEMIA : PRAGUE.

The Prague foot measures 11.88 English inches; and the ell, 23.2 inches.

For the existing weights, measures and money, see Austria.

Bologna; see Roman States.

Bombay; see East Indies.

Bonn; see Prussia.

Bordeaux; see France.

Boston; see United States.

BRAZIL (SOUTH AMERICA).

The old weights and measures are, with the exception noticed below, the same as those of Portugal. The metric system of France has lately been adopted.

The medida	=	$\frac{1}{2}$	English imperial gallon.
„ alqueire	=	1.1004	imperial bushel.
	=	0.1378	„ quarter.
„ mark	=	7.3781	ounces troy.

The rate of exchange for government estimates is pence to the milreis (paper currency). At this rate of exchange to reduce milreis to English pounds, divide by 4 and to the quotient at its $\frac{1}{4}$ th part.

For further information, see Portugal.

BREMEN (GERMANY).

Length.

	ENGLISH VALUE.
10 linien make 1 zoll (inch)	0.95 inches.
12 zoll „ 1 fuss (foot)	11.38 „ or 0.9483 feet.
2 fuss „ 1 elle (ell)	22.76 „ 1.8967 „
8 ellen „ 1 ruthe (rood)	15.174 feet or 5.058 yards.
The klafter is 3 ellen	5.69 feet.
The meile is 20,000 Rhenish feet	6865 yards or 3.9006 miles.

Surveyors divide the fuss decimally.

Surface.

The morgen is 120 square ruthen (3070 square yards or 0.6313 acre)

Liquid Capacity.

4 mingel	make 1 quartier	0.1772 gallons.
9 quartier	„ 1 viertel	1.5953 „
5 viertel	„ 1 anker	7.9763 „
4 anker	„ 1 ohm	31.9052 „
6 ohm	„ 1 fuder	191.4315 „
1 fuder	stübchen (gallon) is 4 quartier	0.709 „
1 fuder	hoft (hogshead) is 6 anker	47.858 „

Dry Capacity.

			ENGLISH VALUE.	
4 spinte	make	1 viertel	0·5094	bushels.
4 viertel	„	1 scheffel	2·0377	„
40 scheffel	„	1 last	81·5088	„ or 10·1886 quarters.

Weight.

4 ort	make	1 quentchen	60·1	grains or	0·1373	oz.
4 quentchen	„	1 loth	240·3	„	0·5493	„
2 loth	„	1 unze	480·6	„	1·0986	„
8 unzen	„	1 mark	3845	„	0·5493	lb.
2 mark	„	1 pfund	7690	„	1·0986	„

Gold and silver are weighed by the mark of Cologne (3609 grains troy). For apothecaries' weights, see Nürnberg.

Money.

5 schwaren	make	1 grot	0·55	d. sterling.
72 grot	„	1 rixdollar } or thaler }	39·4	d. „
48 grot	(silver piece)		27	d. „

For the new imperial measures, weights, and moneys, now in use, see Germany, page 78.

British Islands ; see Great Britain.

BRITISH POSSESSIONS IN NORTH AMERICA.

Throughout the United Canadas, New Brunswick, Nova Scotia, Prince Edward's Island, Newfoundland and the territories of the Hudson's Bay Company, the weights and measures are those of Great Britain, but generally with the old measures of capacity in wine gallons and Winchester bushels, and therefore the same as in the United States.

The moneys of account are either in pounds, shillings and pence sterling, in the same denominations of money in a nominal currency, or in dollars and cents.

According to the Halifax currency, which prevails throughout these provinces, the Spanish or American dollar is valued at 5*s.* or 60*d.* currency, and what is called sterling

valuation of the dollar at the former standard of 4*s.* 6*d.*, and between this and the Halifax currency, the proportion is as 9 to 10, making 90*l.* nominal sterling (in dollars at 4*s.* 6*d.*) equal to 100*l.* in Halifax currency.

But if the sterling value of the dollar be estimated at 4*s.* 2*d.*, the par of exchange should be 83*l.* 6*s.* 8*d.* nominal sterling for 100*l.* Halifax currency, the same being in the proportion of 5 to 6. This proportion exists in New Brunswick. In Canada and Nova Scotia it is 4 to 5. In Newfoundland the dollar passes for 5*s.*, and its assumed value is 4*s.* 4*d.* sterling, making the par of exchange 86*l.* 13*s.* 4*d.* nominal sterling for 100*l.* currency, being in the proportion of 13 to 15; but as the dollar is here overrated as to its sterling value, bills on England usually bear a premium of about 5 per cent.

The decimal coinage of the United States has been recently adopted.

In Lower Canada, wheat is measured by the minot, an old French measure (1·0736 imperial bushel). Land is measured by the arpent, another old French measure (0·8449 acre).

BRUNSWICK (GERMANY).

Length.

	ENGLISH VALUE.
12 zoll make 1 schuh (shoe or foot)	11·23 inches or 0·9358 feet.
2 schuh „ 1 elle	22·46 „ 1·8717 „
The meile (34424 Rhineland feet) =	11816 yards or 6·7140 miles.

Surface.

The morgen (30720 square schuh) = 26904 square feet or 0·6176 acre.

Liquid Capacity.

2 nössel make 1 quartier	0·205 gallons.
4 quartier „ 1 stübchen	0·82 „
49 stübchen „ 1 ohm	32·80 „
The fuder (4 oxhoft) of wine = 240 stübchen	196·8 gallons.
The fass (4 tonnen) of beer = 108 „	88·50 „

Dry Capacity.

			ENGLISH VALUE.
4 becher or löchers make	1 vierfass		0·2139 bushels.
4 vierfass	„	1 himt	0·8556 „
10 himt	„	1 scheffel	8·5560 „ or 1·0695 quarter.

Weight.

2 heller	make	1 pfennig	14·1 grains.
4 pfennig	„	1 quentchen	56·3 „
4 quentchen	„	1 loth	225·3 „ or 0·515 oz.
16 loth	„	1 mark	3605 „ 0·515 lb.
2 mark	„	1 pfund	7210 „ 1·030 „
The liespfund is 14 Brunswick pfund			14·42 lbs.
The centner „ 114 „ „			117·42 „
The schiffpfund (ship-pound) is 20 liespfund			288·40 „

Gold and silver are weighed by the mark of Cologne (3609 grains troy).

For apothecaries' weights, see Nürnberg.

For the new imperial measures, weights, and moneys, now in use, see Germany, page 78.

Brussels; see Belgium.

Cadiz; see Spain.

Cairo; see Egypt.

Calcutta; see East Indies.

Canada; see Great Britain, and British Possessions in North America.

Ceylon; see East Indies.

CANARY ISLANDS (IN ATLANTIC).

The measures, weights, and coins are from Spain, but several of them are somewhat variable and depreciated in value.

For long measure the pié is the Castilian foot (11·128 English inches).

The standard libra, or pound, is 1·0148 lb. avoirdupois.

CANDIA (IN MEDITERRANEAN).

		ENGLISH VALUE.
The pic or ell	=	25·11 inches.
The mistate (for oil)	=	2·456 gallons.
The carga (for corn)	=	4·189 bushels.
The cantaro of 100 rottoli or 44 occas }		116½ lbs.
40 paras make 1 piastre		2½d. sterling.

Canton; see China.

CAPE OF GOOD HOPE (BRITISH COLONY).

For measures and weights, see Great Britain, page 44.

Money.—British currency is also used; and occasionally the former Dutch currency, according to which,

6 stivers	make 1 skilling		2½d. sterling.
8 skillings	„ 1 rixdollar		18d. „

Cape Verd Islands (in Atlantic); see Portugal.

Cassel (Germany); see Hesse Cassel.

Castile; see Spain.

CEYLON (INDIA): COLUMBO.

The parrah is 5·62 gallons; and the seer 1 quart.

The candy or bahar weighs 500 lbs. avoirdupois.

Measures of length and surface are the same as in England.

Since 1825, by order in council, the public accounts are kept in British money, with the following values of the coin in circulation:—

The rixdollar	1s. 6d. sterling.
The Spanish dollar	4s. 2d. „
The Sicca rupee	2s. „
The rupee of Madras and Bombay	1s. 10d. „

But the Sicca rupee has superseded the sterling currency in all commercial transactions.

— *Christiana*; see Sweden and Norway.

CHINA.

Length.

		ENGLISH VALUE.
10 fans	make 1 tsun	1·41 inches.
10 tsuns	„ 1 chik or coid	14·1 „
10 chiks	„ 1 cheüing or fathom	141 „ or 11·75 feet.
10 cheüings	„ 1 yan	117·5 feet.
Surveyors and engineers' chik		12·70 inches.
Itinerary	„	12·17 „
Pekin	„	13·12 „
Canton (commercial)	„	14·70 „
Imperial	„	12·612 „

The li or mile (1800 itinerary chiks) = 1826 English feet.

Capacity.

10 kops	make 1 shing tsong	0·12 gallons or 0·96 pints.
10 shings	„ 1 tau (12 catties)	1·2 „ 9·6 „
10 taus	„ 1 hwüh	12·0 „ 96·0 „

The measures of dry capacity are nearly $\frac{1}{3}$ greater than these.

Weight.

16 taels	make 1 catty or pound	1 $\frac{1}{2}$ avoirdupois lbs.
100 catties	„ 1 pecul or tam	133 $\frac{1}{2}$ „ „

Therefore the tael or ounce (10 mace) = $\frac{1}{16}$ lb. or 583 grains.

Money.

10 cash ("le")	make 1 candereen ("fun")	$\frac{3}{4}$ d. sterling.
10 candereens	„ 1 mace ("tsëen")	7 d. „
10 mace	„ 1 tael ("lëang")	70 d. „

These moneys, excepting the cash, are imaginary, and are formed from weights of Sysee silver, under the same denominations; and the tael in the money and commercial weights are alike. The touch or fineness of Sysee silver is 0·980. The cash are casts of common metal with a square hole in the middle, through which they are *strung like beads in various numbers*. Silver ingots from $\frac{1}{2}$

to 100 taels are used as money ; but gold is considered as merchandise, and is sold in ingots, called shoes. If the metals be sysee or pure, 10 taels of silver are given for 1 of gold.

Coblentz ; see Prussia.

COLOGNE (PRUSSIA).

In 1816 a uniform system of weights and measures was decreed for all the Prussian dominions, for which see Prussia. The Rhineland foot was adopted as the standard unit for measures of length, and the Cologne mark as the unit for weights. As the system of weights previously established at Cologne is still in use throughout Germany, it is here inserted for reference.

Weight.

			ENGLISH VALUE.	
4 pfennig	make	1 quentchen	56·4 grains.	
4 quentchen	„	1 loth	225·56	„
2 loth	„	1 unze	451·12	„
8 unzen	„	1 mark	3609	„ or 0·51557 lb.
2 mark	„	1 pfund	7218	„ 1·03114 „

The standard copy of the Cologne mark in use at Hamburg has been ascertained to weigh 8608 English grains, being 1 grain lighter than the average of the Prussian standards.

For the new imperial measures, weights, and moneys, now in use, see Germany, page 78.

Constantinople ; see Turkey.

Copenhagen ; see Denmark.

Corsica (in Mediterranean) ; see France.

CRACOW (POLAND).

The Cracow foot = 14·032 inches or 1·1693 foot.

Cremona (Italy) ; see Venetian Lombardy.

Cuba ; see West Indies.

Damascus ; see Ottoman Asia.

Dantzic ; see Prussia.

Demerara ; see West Indies.

DENMARK.

Length.

ENGLISH VALUE.

12 linien	make 1 tomme	1.03 inches.
12 tommen	„ 1 fod	12.357 „ or 1.0298 feet.
2 fod	„ 1 aln	24.714 „ 2.0595 „
The mil is 12000 aln		24,714 feet or 4.6807 miles.

Liquid Capacity.

	pott	=	0.2126 gallons.
2 pott	make 1 kande		0.4252 „
2 kanden	„ 1 stübchen		0.8504 „
2 stübchen	„ 1 viertel		1.7008 „
4 $\frac{1}{8}$ viertel	} „ 1 anker		8.2914 „
= 39 pott			

Dry Capacity.

	pott	=	0.02657 bushels.
18 pott	make 1 skieppe		0.47835 „
2 skieppen	„ 1 fjerding		0.9567 „ or 0.1196 quarter
4 fjerding	„ 1 tonne		3.8268 „ 0.47835 „
22 tonnen	„ 1 last		84.188 „ 10.5235 „

The liquid and dry pott measures are identical in capacity.

Weight.

4 ort	make 1 quintin	60.3 grains or 0.1378 oz.
4 quintin	„ 1 lod	241.2 „ 0.5514 „
2 lod	„ 1 unze	482.5 „ 1.1029 „
8 unzen	„ 1 mark	3860 „ 0.5514 lb.
2 mark	„ 1 pund	7720 „ 1.1029 „
The lispund is 16 pund		17.646 lbs.
The skippund is 20 lispund		352.914 „ or 3.151 cwt.

For gold and silver the pound is 7266 English grains, and is divided the same as the preceding.

The metric system of measures and weights is now being adopted.

Money.

		ENGLISH VALUE.
16 skillinge make 1 mark		4·4 <i>d.</i> sterling.
6 mark	" 1 { rigsbank or rix-banco } dollar	26·35 <i>d.</i> "
The Danish specie dollar		51·4 <i>d.</i> "

Since 1873 the monetary system has been—

100 öre make 1 kronor | 1*s.* 1·3*d.* sterling.

Dresden ; see Saxony.

EAST INDIES.

1. BENGAL : CALCUTTA.

Length.

3 jows or barleycorns make 1 unglee or finger		$\frac{1}{4}$ inch.
4 unglees	" 1 moot or hand	3 inches.
3 hands	" 1 span	9 "
2 spans	" 1 haut or cubit	18 "
2 cubits	" 1 guz or yard	36 " or 3 feet.
2 yards	" 1 fathom	6 feet.
1000 fathoms	" { 1 Bengal coss } or mile	6000 " or 1 $\frac{1}{3}$ mile.

Liquids and grain are measured by weight.

Weight.

		FACTORY.	BAZAAR.
5 siccas make 1 chittack		0·1167 lbs.	0·1283 lbs.
16 chittacks	" 1 seer	1·8667 "	2·0533 "
40 seers	" 1 maund	74·667 "	82·133 "
30 maunds =		20 cwt.	22 cwt

These are the avoirdupois values of the Factory and Bazaar weights, the latter being 10 per cent. heavier than the former. The new Indian sicca weight or tola (180 grains), established in 1833, is $\frac{1}{3}$ grain heavier than the above, and it corresponds with the weight of the Company's silver rupee, and also with that of the gold mohur.

Money.

12 pie or pice make 1 anna		1·4 <i>d.</i> sterling.
16 annas	" 1 Company's rupee	22·4 <i>d.</i> "
The Sicca rupee	=	23·8 <i>d.</i> "
the gold mohur of 16 sicca rupees		32 <i>s.</i> "

80 silver rupees, or 36 copper annas, weigh 80 new Indian tolas, or 1 seer, which proportions suggest a ready and available means of testing the correctness of the Bazaar weights.

2. MADRAS.

Length.—The coid for cloth measure is 18·6 inches; but the English yard is generally used.

Capacity.

		ENGLISH VALUE.
8 ollucks	make 1 measure or puddy	0·338 gallons.
8 measures	„ 1 marcal	2·704 „
5 marcals	„ 1 parah or chunam	13·52 „
80 parahs	„ 1 garce, weighing 8400 lbs. }	135·2 bushels or 16·9 quarters

Weight.

10 pagodas	make 1 pollam	0·078 lbs. avoirdupois.
8 pollams	„ 1 seer	0·625 „ „
5 seers	„ 1 vis	3·125 „ „
8 vis	„ 1 maund	25 lbs.
20 maunds	„ 1 candy	500 „

Money.—Same as Bengal.

3. BOMBAY.

Length.

16 tussoos	make 1 hath	18 inches.
24 tussoos	„ 1 guz	27 „

Capacity.

16 adoulies	make 1 parah	3·03 bushels.
3 parahs	„ 1 candy	24·24 „

Weight.

30 pice or 72 tanks	make 1 seer	0·7 lb.
40 seers	„ 1 maund	28 lbs. or $\frac{1}{2}$ cwt.
20 maunds	„ 1 candy	560 „ 5

Money.

100 reas	make 1 quarter	5·6 <i>d.</i> sterling.
4 quarters } or 16 annas }	" 1 rupee	22·4 <i>d.</i> "

The gold mohur or 15 rupee piece is of the same weight and purity as the silver rupee, 15 alloy and 165 fine grains, and its value at the British mintage rate is 1*l.* 9*s.* 2*d.* The gold pagoda star is valued at 7*s.* 4*d.* sterling.

A lac is 100,000 and a crore is 10 millions of rupees.

At Singapore the Spanish dollar circulates at 2·18 rupees or 4*s.* 1*d.* sterling.

See also Ceylon.

EGYPT (AFRICA).

Length.—4 derahs make 1 gasab (2·832 English yards).

The principal measure for cloth and silk is the pic (26·8 English inches).

Ancient Measures.

The natural cubit (24 Egyptian fingers) is 17·71 inches.

" royal " (28 " ") 20·66 "

Surface.—The feddan al risach, or acre, is 400 square gasab = 3208 square yards or 0·6628 acre.

Capacity.—24 robs make 1 ardeb (4·9 imperial bushels or 0·6125 quarter).

Weight.

	ENGLISH VALUE.
144 drachmas or meticals make 1 rotl or pound	1·008 lbs.
100 rottoli " 1 cantaro	100·8 "
The oke is 400 drachmas	2·8 "

Money.—40 paras make 1 piastre (2½*d.* sterling).

Elsinore ; see Denmark.

England ; see Great Britain.

Falkland Islands ; see Great Britain.

Finland ; see Russia.

Flanders ; see Belgium.

Florence ; see Tuscany.

FRANCE.

1. METRICAL SYSTEM NOW IN USE.

Length.

	ENGLISH VALUE.
Millimètre (1000th of a mètre)	0.03937 inches.
Centimètre (100th of a mètre)	0.39371 "
Décimètre (10th of a mètre)	3.93708 "
Mètre (unit of length)	39.3708 " or 3.2809 feet.
Décamètre (10 mètres)	32.809 feet. 10.9363 yards.
Hectomètre (100 mètres)	328.09 " 109.3633 "
Kilomètre (1000 mètres)	1093.63 yards or 0.62138 miles.
Myriamètre (10,000 mètres)	10936.33 " 6.21382 "

Surface.

Centiare { (100th of an are or a square mètre) }	1.1960 square yards.
Are { (square décamètre and unit of surface) }	119.6033 " " or 0.0247 acres.
Decare (10 ares)	1196.033 " " 0.2474 "
Hectare (100 ares)	11960.33 " " 2.4736 "

Capacity.

Millitre { (1000th of a litre or cubic centimètre) }	0.06103 cubic inches.
Centilitre (100th of a litre)	0.61027 " "
Déclilitre (10th of a litre)	6.10270 " "
Litre { (cubic décimètre and unit of capacity) }	61.02705 " " or 1.7608 pints.
Décalitre (10 litres)	610.2705 " " 2.2010 gallons.
Hectolitre (100 litres)	3.53166 cubic feet 22.0097 "
Kilolitre { (1000 litres or cubic mètre) }	35.31658 " " 220.0967 "
Myrialitre (10,000 litres)	353.1658 " " 2200.9667 "

Solid.

Décistère (10th of a stère)	3.5317 cubic feet.
Stère (cubic mètre)	35.3166 " "
Décastère (10 stères)	353.1658 " "

Weight.

	ENGLISH VALUE.
Milligramme (1000th of a gramme)	0·0154 grains.
Centigramme (100th of a gramme)	0·1544 „
Décigramme (10th of a gramme)	1·5440 „
Gramme (unit of weight)	15·44 „
Décagramme (10 grammes)	154·4 „
Hectogramme (100 grammes)	1544 grains { 3·2167 oz. troy, or 3·5291 oz. avoirdupois.
Kilogramme (1000 grammes)	32½ oz. troy or 2·2057 lbs. „
Myriagramme (10000 grammes)	321½ „ 22·057 „ „

The foregoing metric system is now adopted in Austria, Belgium, Greece, Holland, Germany, Italy, Norway, Portugal, Spain, Sweden, and Switzerland.

2. "SYSTEME USUEL."

(Formerly in use, but interdicted since 1840).

Length.

12 lignes make 1 pouce	1·094 inches.
12 ponces „ 1 "pied usuel"	13·124 „ or 1·0936 feet.
3 pieds „ 1 mètre	39·371 „ 3·2809 „
2 mètres „ 1 toise	78·742 „ 6·5618 „
The aune is { 12 décimètres } { 1½ mètre }	47·245 „ 3·9371 „

Weight.

72 grains make 1 gros	60·31 grains troy.
8 gros „ 1 once	482·5 „ = 1 0052 oz. troy.
8 onces „ 1 mark	3860 „ = 8·0417 „
2 marks „ 1 livre = 500 grammes }	7720 „ { = 1·3403 lb. troy, or 1·1029 „ avoird.

3. ANCIENT SYSTEM.

Length.

12 lignes make 1 pouce or inch	1·066 inches.
12 ponces „ 1 "pied de Roi" (0·3249 mètre)	12·79 „
6 pieds „ 1 toise (1·9492 „)	6·395 feet.
The aune (1·1880 „)	46·85 inches.
de poste " (2000 toises)	4263 yards or 2 4222 miles.

Weight.

ENGLISH VALUE.

72 grains make 1 gros	59.0 grains troy.
8 gros „ 1 once	472.2 „ „ = 0.9837 oz. troy.
8 onces „ 1 mark	3777.5 „ „ = 7.8698 „
2 marks „ 1 poids de marc	7555 „ „ { 1.3116 lb. troy, or 1.0793 „ avoirdupois.

Money.

10 décimes } make 1 franc	9.4d. sterling.
100 centimes }	
5 franc piece in silver	3s. 11d. „
10 franc piece in gold	7s. 11d. „
20 franc piece or Napoleon	15s. 10d. „

There are gold coins of 5, 10, 20, 50, and 100 francs, and silver coins of 1, 2, and 5 francs ; also bronze coins of 1, 2, 5, and 10 centemes.

FRANKFORT-ON-THE-MAINE (GERMANY).

Length.

The foot measures 11 27 English inches, and the ell 21.54 inches.

Liquid Capacity.

4 eich-mass } make 1 viertel	1.5784 gallons.
1 ½ neu-mass }	
20 viertel „ 1 ohm	31.5674 „
6 ohm „ 1 fuder	189.4044 „

The mass is also divided into 4 schoppen.

Dry Capacity.

1 schrot make 1 mässchen	0.01233 bush. ls.
1 mässchen „ 1 gescheid	0.04932 „
4 gescheid „ 1 sechter	0.1973 „
2 sechter „ 1 metze	0.3946 „
2 metzen „ 1 simmer	0.7892 „
1 simmer „ 1 malter or achtel	3.1568 „

Weight.

		ENGLISH VALUE.	
2 heller	make 1 pfennig	14.1	grains or 0.0322 oz.
4 pfennig	„ 1 quentchen	56.4	„ 0.1289 „
4 quentchen	„ 1 loth	225.6	„ 0.5157 „
2 loth	„ 1 unze	451.2	„ 1.0314 „
8 unzen	„ 1 mark	3610	„ 0.5157 lb.
2 mark	„ 1 pfund	7220	„ 1.0314 „

The heavy weight is 8 per cent. more than this table ; and the zoll-centner is 110.24 lbs. avoirdupois.

Apothecaries' weight is the same as at Nürnberg.

Money.

The gold ducat is about 9s. 4d. sterling.

For the imperial measures, weights, and moneys, now in use, see Germany (below).

Frankfort-on-the-Oder ; see Prussia.

Gallen, St. Gall ; see Switzerland.

Geneva ; see Switzerland.

Genoa ; see Sardinia.

GERMANY.

See Austria, Baden, Bavaria, Bohemia, Bremen, Brunswick, Cologne, Frankfort, Hamburg, Hanover, Hesse, Lubeck, Prussia, and Saxony.

The measures and weights throughout Germany are now those of the metric system, the meter or stab (staff or ell) and the kilogramme being the principal units ; the millimeter is also denominated strich (linie) ; see France, p. 75.

The present imperial monetary system for the whole of Germany is—

100 pfennige make 1 Reichs-mark | 1s. sterling.

GIBRALTAR.

The weights and measures are those of Great Britain.

Money.

10 decimas	make 1 real vellon	2.5d. sterling.
20 reals	„ 1 dollar (Spanish)	4s. 2d. „
16rs	„ 1 doubloon (Spanish)	66s. 8d. „

The Spanish hard dollar is a legal tender at this rate in all the British Colonies. By an order in council, issued in 1845, it was directed that Spanish, Mexican, and South American dollars shall be legal tenders at 4s. 2d. sterling; and that gold doubloons, or 16 dollar pieces, of the same countries, shall pass for 3l. 6s. 8d. Mercantile operations are carried on in dollars and cents.

Great Britain; see page 44.

GREECE.

Length.

	ENGLISH VALUE.
The short picha (used for silks)	25 inches.
„ long „ (woollens and linens)	27 „
Ancient Greek foot (16 Egyptian fingers)	11·81 „
„ Attic or Olympic foot	12·10 „
„ Pythic foot	9·75 „

The cubit is $1\frac{1}{2}$ feet and the stadium 400 cubits or 600 feet.

Capacity.

The kila measures 0·9152 bushel or 0·1144 quarter.

The staro, of 3 bachel, measures 2·259 bushels.

The ancient keramion or metretes is 8·488 gallons.

Weight.

The pound is 6168 grains or 0·8811 lb. avoirdupois.

The cantaro, of 40 okes, is 112 lbs. or 1 cwt.

The French metric system is now uniformly established, only with a different nomenclature; see p. 75.

Money.

The silver drachma (=100 lepta or centimes)	8·4d. sterling.
The 5 drachma silver piece	3s. 6d. „
The 10 drachma „ „	7s. 0d. „
The 20 drachma gold piece	14s. 2d. „

GUINEA (AFRICA).

Length.—The jacktan = 12 English feet.

Weight.

	ENGLISH VALUE.
2 media-tabla make 1 aguïrage	62 grains.
2 aguïrages „ 1 piso or uzan	124 „
4 pisos „ 1 benda-offa	496 „
2 benda-offas „ 1 benda	992 „
The quinto is 3 media-tabla	93 „
„ seron „ 6 „ „	186 „
„ eggēba „ 10½ „ „	330 „

Money.—100 cents make 1 dollar (50*d.* sterling).

The decimal system was introduced in 1839, the previous money being that of Holland, of which 3 guilders were to represent 1 dollar currency.

HAMBURG (GERMANY).

8 achtel make 1 zoll	0·94 inches.
12 zoll „ 1 fuss	11·29 „ or 0·9408 feet.
2 fuss „ 1 elle	22·58 „ 1·8817 „ or }
	0·6272 yard. }
The Rhenish foot	12·357 „ 1·0298 feet.

Engineers and surveyors use the Rhenish foot and inch, decimally divided.

The meile is 24000 Rhenish feet = 4·6807 English miles.

Surface.—The morgen is 117600 square fuss = 2·3895 acres.

Liquid Capacity.

2 össel make 1 quartier	55·2 cubic inches or 0·1992 gallons.
2 quartier „ 1 kanne	110·4 „ „ 0·3983 „
2 kannen „ 1 stübchen	220·9 „ „ 0·7967 „
2 stübchen „ 1 viertel	441·8 „ „ 1·5934 „
5 viertel „ 1 anker	2209 „ „ 7·9668 „
4 anker „ 1 ohm	8836 „ „ 31·867 „
6 ohm „ 1 fuder	53016 „ „ 191·202 „
The eimer is 4 viertel	6·3734 gallons.
The tonne is 24 „	38·2404 „
The oxhoft is 30 „	47·8006 „

Dry Capacity.

		ENGLISH VALUE.	
4 spinte	make 1 himt	1606·5 cubic inches	or 0·7242 bushels.
2 himt	„ 1 fass	3213	„ „ 1·4485 „
2 fass	„ 1 scheffel	6426	„ „ 2·8969 „
10 scheffel	„ 1 wispel	64260	„ „ 28·9694 „
3 wispel	„ 1 last	192780	„ „ 86·9083 „
		or 1·0864 lasts. }	

Weight.

4 pfennig	make 1 quentchen	58·4 grains.	
4 quentchen	„ 1 loth	233·6	„
2 loth	„ 1 unze	467·2	„ or 1·068 oz.
2 unzen	„ 1 mark	3738	„ 8·544 „
2 mark	„ 1 pfund	7476	„ 1·068 lbs.

The schiffpfund or 20 liespfund is 280 pfund.

Gold and silver are weighed by the Cologne mark ; and medicine by Nürnberg apothecaries' weight.

Money.

12 pfennige	make 1 schilling	0·9 <i>d.</i> sterling.
16 schillinge	„ 1 mark	1 <i>s.</i> 2½ <i>d.</i> „
3 mark	} „ 1 rixdollar } (nominal)	3 <i>s.</i> 7 <i>d.</i> „
48 schillinge		
The mark banco (imaginary)		1 <i>s.</i> 5½ <i>d.</i> „
The rixdollar specie		4 <i>s.</i> 5·7 <i>d.</i> „
The gold ducat		9 <i>s.</i> 4 <i>d.</i> „

The weight of the Cologne mark, according to the Hamburg standard, is 3608 English troy grains. This weight of *fine* silver is coined into 34 marks, and its value, at the rate of 5*s.* sterling per ounce standard, is 40*s.* 7*d.*; hence the value of the “mark current” as above. Banco is a nominal valuation of the Cologne mark of silver at $27\frac{3}{4}$ marks Banco, according to which the estimated value of the “mark banco” is 17½*d.* sterling.

For the new imperial measures, weights, and moneys, now in use, *see Germany*, p. 78.

HANOVER (GERMANY).

Length.

			ENGLISH VALUE.	
12 linien	} make 1 zoll		0·95 inches.	
= 8 achtel				
12 zoll	„	1 fuss	11·45	„ or 0·9542 feet.
2 fuss	„	1 elle	22·9	„ 1·9083 „
8 ellen	„	1 ruthe	183·2	„ 15·2667 „
The melle (25,400 fuss) =			24236 feet	4·5901 miles.

Surface.—The morgen of Calenberg is 30720 square fus = 3108 square yards or 0·6438 acre.

Liquid Capacity.

2 nössel	make 1 quartier	0·214 gallons.
2 quartier	„ 1 kanne	0·428 „
2 kannen	„ 1 stübchen	0·856 „
2 stübchen	„ 1 viertel	1·7118 „
5 viertel	„ 1 anker	8·559 „
4 anker	„ 1 ohm	34·236 „
6 ohm	„ 1 fuder	205·416 „
The eimer is	8 viertel	13·6944 „
The oxhoft is	30 viertel	51·354 „

Dry Capacity.

4 vierfass	} make 1 himt	0·8556 bushels.	
= 3 drittel			
6 himt	„ 1 malter	5·1337	„ or 0·6417 quarter
8 malter	„ 1 wispel	41·07	„ 5·1337 „
2 wispel	„ 1 last	82·14	„ 10·2675 „

Weight.

4 örtchen	make 1 quentchen	58·7 grains or 0·1341 oz.
4 quentchen	„ 1 loth	234·8 „ 0·5366 „
2 loth	„ 1 unze	469·5 „ 1·0731 „
8 unzen	„ 1 mark	3756 „ 0·5366 lb.
2 mark	„ 1 pfund	7512 „ 1·0731 „

Gold and silver are weighed by the Cologne mark; an *medicine* by Nürnberg apothecaries' weight.

For the new imperial measures, weights, and moneys, n in use, see Germany, p. 78.

Havannah; see West Indies.

Hayti or Haiti (St. Domingo); see West Indies.

HESSE-CASSEL (GERMANY).

Length.

	ENGLISH VALUE.
12 linien make 1 zoll	0·9437 inches.
12 zoll „ 1 (standard) fuss	11·324 „ or 0·9437 foot.
The (surveyors') fuss	11·217 „ 0·9347 „

Surface.—The acker (29400 square surveyors' fuss) = 2854 square yards or 0·5897 acre.

Liquid Capacity.

4 schoppen make 1 mass	0·44 gallons.
4 mass „ 1 viertel	1·76 „
20 viertel „ 1 ohm	35·2 „
6 ohm „ 1 fuder	211·2 „

Dry Capacity.

4 mässchen make 1 metze	0·276 bushels.
4 metzen „ 1 himt	1·105 „
2 himt „ 1 scheffel	2·21 „

Weight.

4 quentchen make 1 loth	234 grains or 0·535 oz.
2 loth „ 1 unze	468 „ 1·07 „
16 unzen „ 1 pfund	7490 „ 1·07 lb.

Gold and silver by the Cologne mark; and apothecaries' weight the same as at Nürnberg.

For the new imperial measures, weights, and moneys, now in use, see Germany, p. 78.

HESSE-DARMSTADT (GERMANY).

Length.

10 linien make 1 zoll	0·984 inches.
10 zoll „ 1 fuss	9·843 „ ($\frac{1}{2}$ French metre).
10 fuss „ 1 klaffer	98·427 „ = 8·2022 feet or 2·7341 yars

Surface.—The morgen is 40,000 square fuss or 400 square klafter = 2990 square yards or 0·6178 acre.

Liquid Capacity.

			ENGLISH VALUE.
4 schoppen	make	1 mass	0·44 gallons.
4 mass	„	1 viertel	1·76 „
20 viertel	„	1 ohm	35·2 „
6 ohm	„	1 fuder	211·2 „

Dry Capacity.

4 mässchen	make	1 gescheid	0·055 bushels.
4 gescheid	„	1 kümpf	0·22 „
4 kümpf	„	1 simmer	0·88 „
4 simmer	„	1 malter	3·52 „

Weight.

4 pfennig	make	1 quentchen	60·3 grains.
4 quentchen	„	1 loth	241·1 „ or 0·5511 oz.
32 lothe	„	1 pfund	7716 „ 1·1023 lb.

Previously to 1821 the weights and measures were those of Frankfort.

For the new imperial measures, weights, and moneys, now in use, see Germany, p. 78.

Hindoostan (Asia) ; see East Indies.

HOLLAND.

With the exception of the old nomenclature, the weights and measures of Holland, since 1817, have been according to the metric system of France.

Length.

The streep	is the	millimètre	0·03937 inches.
„ duim	„	centimètre	0·39371 „
„ palm	„	decimètre	3·93708 „
„ elle	„	mètre	39·3708 „ or 3·2809 feet.
„ roede	„	décamètre	32·809 feet or 10·9363 yards.
„ mijl	„	kilomètre	1093·63 yards or 0·6214 mile.

Liquid Capacity.

The vingerhoed is the centilitre	0·61027 cubic inches.
„ maatje „ decilitre	6·10270 „ „
„ kan „ litre	61·02705 „ „ or 1·7608 pints.
„ vat „ hectolitre	3·53166 cubic feet or 22·0097 gallons.

Dry Capacity.

The maatje is the decilitre	6·10270 cubic inches.
„ kop „ litre	61·02705 „ „

Holstein; see Denmark.

Hungary; see Austria.

IONIAN ISLANDS (IN MEDITERRANEAN).

Since 1817, the weights and measures have been those of Great Britain with Italian designations.

The libbra sottile is the pound troy ; the libbra grossa the pound avoirdupois ; the centinajo is 100 libbre.

The dicotoli is the English pint ; the chilo the bushel ; the barile is 16 gallons ; the stadio is the chain (22 yards), &c.

Money.—104 oboli make 1 Spanish dollar (50*d.* sterling).

Ireland ; see Great Britain.

Jamaica ; see West Indies.

ITALY.

The measures and weights now adopted throughout Italy are those of the metric system of France ; see p. 75.

Money.

100 centimes make 1 lira.		ENGLISH VALUE. 9·125 <i>d.</i> sterling.
---------------------------	--	---

For former measures, weights, and moneys, see Modena, Naples, Parma, Roman States, Sardinia, Sicily, Tuscany, and Venetian Lombardy.

JAPAN (ASIA).

The long measure of Japan is the inc ($6\frac{1}{4}$ English feet).

Money.

10 rin make 1 sen		$\frac{1}{2}$ <i>d.</i> sterling.
100 sen „ 1 yen		4 <i>s.</i> 2 <i>d.</i> „

ISLAND OF JAVA: BATAVIA.

Length.—The ell is $27\frac{1}{2}$ English inches ; the foot is the Rhineland foot (12·857 inches) ; the ikje (3 ells) is $83\frac{1}{2}$ inches.

Capacity.—The kanne is about $\frac{2}{3}$ of an English gallon.

Weight.—The weights are those of China.

Money.—The old florin of Batavia is valued at $19\frac{1}{4}$ *d.* sterling ; the rixdollar $87\frac{1}{2}$ *d.* ; and the new gulden or florin of the Netherlands is valued at 20*d.* sterling. See Holland.

Kiel ; see Germany.

Malaga; see Spain.

MALTA (IN MEDITERRANEAN).

Length.—The foot is 11.17 English inches; the palmo is 10.3 inches; and the canna is 8 palmi or 82.4 inches.

Capacity.

	ENGLISH VALUE.
The caffiso of oil is	4.580 gallons imperial.
„ barile of wine is	9.160 „ „
„ salma of corn is	7.969 bushels.

Weight.

The rottolo of 30 ounces is		1½ lbs. avoirdupois.
„ cantaro of 100 rottoli is		175 „ „
64 rottoli make		1 cwt.

Money.

20 grani make 1 tari		1.65 <i>d.</i> sterling
12 tari „ 1 scudo		20 <i>d.</i> „
2½ scudo } 1 pezza,	}	50 <i>d.</i> „
= 30 tari } „ Sicilian dollar		

As dollars and doubloons here form the principal circulating medium, it was ordered, in 1845, that the Spanish or South American dollar should pass for 4*s.* 2*d.* or 30 tari,

and the Sicilian dollar for 4*s.* or 28 tari and 16 grani. But the pezza or dollar of Sicily is usually valued at 50*d.* as above stated.

Marseilles ; see France.

MAURITIUS (IN INDIAN SEA).

For weights and measures, see Great Britain ; and also France (" ancient system ").

Money.—100 cents make 1 current dollar (50*d.* sterling).

The Spanish dollar is valued at 4*s.* 4*d.* sterling, and is divided into halves, quarters, eighths, and sixteenths.

In 1843 an order in council established the pound sterling as the money for public accounts, and gave to the coins circulating in the colony the following values :—

Dollars of Spain, Mexico, { and South America	4 <i>s.</i> 2 <i>d.</i> = 1·04½	Mauritius dollars.		
East India Company's rupee	1 <i>s.</i> 10 <i>d.</i> = 0·45½		"	"
" " " gold mohur	2 <i>s.</i> 2 <i>d.</i> = 7·29½		"	"
5 francs	3 <i>s.</i> 10 <i>d.</i> = 0·96½		"	"
Napoleon of 20 francs	15 <i>s.</i> 10 <i>d.</i> = 3·95½		"	"

To obviate fractions, the population freely pass rupees at two to the Mauritius dollar ; which, therefore, represents only 3*s.* 8*d.* instead of 4*s.* Thus British coins are practically excluded, excepting in government transactions, and rupees have become the principal currency.

Subsequent to 1875 the metric system of France has been introduced into the Mauritius and its dependencies.

Primary standards of the metre, litre, and kilogram have recently been issued for that government by the Board of Trade.

MECKLENBURG-SCHWERIN } (GERMANY).
MECKLENBURG-STRELITZ }

The weights and measures were the same as Hamburg, with the exception of measures of capacity which were those of Lubeck. For metric system now in use, see Germany.

Memel ; see Prussia.

MEXICO (NORTH AMERICA).

The weights and measures of Mexico are those of Spain, with some local variations difficult to ascertain and enumerate. See Spain.

Accounts are kept in pesos or dollars of 8 reals, the real being usually valued at 6 pence sterling.

Milan (Italy); see Venetian Lombardy.

Mocha; see Arabia.

MODENA (ITALY).

Length.

The piede, or foot, is 20·592 English inches.

6 piedi make 1 cavezzo (123·55 inches = 10·296 feet
= 3·432 yards).

The braccio (2½ Genoa palmi) = 24·52 inches.

Surface.—The biolca, of 72 tavole (288 square cavezzi) = 3392 square yards or 0·7009 acre.

Liquid Capacity.

ENGLISH VALUE.

2 boccali make 1 fiasco		0·4584 gallons.
20 fiasci „ 1 barile		9·1680 „

Dry Capacity.

2 staja make 1 sacco		3·876 bushels or 0·4845 quarter.
----------------------	--	----------------------------------

Weight.

NÜRNBERG, OR NUREMBERG (BAVARIA).

The apothecaries' weight of Nürnberg is used for medicines throughout Germany. Its pfund is $\frac{3}{4}$ of the old Nürnberg money pound, or $1\frac{1}{4}$ old Nürnberg mark, and is subdivided thus:—

20 gran make 1 scrupel	19·2 grains.
3 scrupel „ 1 drachme	57·5 „
8 drachmen „ 1 unze	460 „ or 0·9583 oz. troy.
12 unzen „ 1 pfund	5520 „ 11½ „ „

For further particulars of the weights, measures, and money of Nürnberg, see Bavaria.

Odessa; see Russia.

Oporto; see Portugal.

Ostend; see Belgium.

OTTOMAN ASIA: ALEPPO, SMYRNA, &c.

The Turkish pic (26·8 inches) is used for measures of length, and the oke for weight. At Damascus the pic is 23 inches.

Weight.

6 okes	make 1 batman	16·974 lbs.
7½ batman	„ 1 cantaro	127·305 „

Ottoman Empire; see Turkey.

Padua (Italy); see Venetian Lombardy.

Palermo (Sicily); see Sicily.

Paris; see France.

PARMA (ITALY).

Length.

ENGLISH VALUE.

12 atomi	make 1 punto	0·15 inches.
12 punti	„ 1 oncia	1·78 „
12 oncie	„ 1 braccio di legno	21·34 „ or 1·7783 feet.
6 braccia	„ 1 pertica	128·04 „ 10·6700 „
The pié or foot	=	22·428 „ 1·8690 „

Surface.—The biolca, of 6 stari (288 square pertica) = 3643 square yards or 0·7527 acre.

Liquid Capacity.—See Milan.

Dry Capacity.

8 quartaröli	make 1 mina	0·7066 bushels.
2 mine	„ 1 stájo	1·4132 „

Weight.

24 grani	make 1 denaro	17·5 grains.
24 denari	„ 1 oncia	419·8 „
12 oncie	„ 1 libbra	5038 „ or 0·7197 lb.
25 libbre	„ 1 rubbio	17·99 lbs.

For gold and silver weight, see Venetian Lombardy.

Money.

The 5 lire silver piece (1815)	3s. 11d. sterling.
„ 20 „ „ „	15s. 10d. „
The gold sequin (zecchino)	9s. 5d. „

For more recent information see Italy, p. 86.

PERSIA (ASIA).

Length.

The royal guerze, or monkelser, is $37\frac{1}{2}$ English inches.

The common guerze is $\frac{2}{3}$ the royal, or 25 " "

The arish is 38·27 English inches.

Capacity.

		ENGLISH VALUE.
4 sextarios make 1 chenic		80·26 cubic inches.
2 chenic	1 capich	160·52 " "
25 capich	1 artaba	4013 " " or 1·809 bushels.

Weight.

2 mascais make 1 dirhem		0·0423 lbs. or 0·0211 lbs.
50 dirhem	1 rattel	2·1136 " 1·0568 "
6 rattels	1 batman	12·6816 " 6·3408 "

Both sorts of weights are used with these divisions.

The batman of Shirez is 12·6816 lbs. avoirdupois.

" " Tauris " 6·3408 " "

The dirhem used for weighing gold and silver = 150 grains troy.

Money.

5 dinars simple make 1 kasbequis		0·216d. sterling.
2 kasbequis	1 dinars-bisti	0·432d. "
5 dinars-bisti	1 shatree	2·16d. "
2 shatrees	1 mamoodi	4·32d. "
2 mamoodi	1 abassi	8·64d. "
50 abassi	1 toman	1l. 16s. "
The silver rupee		1s. 11d. "
" gold "		1l. 9s. 2d. "

The above dinar and toman are imaginary moneys of account, not represented by coins. The Persian gold toman is worth about 11s. sterling; and the silver rupee about 18d.

Petersburg; see Russia.
 Philadelphia; see United States.
 Piedmont; see Sardinia.
 Pondicherry (Asia); see France.

PORTUGAL.

Length.

		ENGLISH VALUE.
12 pontos	make 1 linha or line	0·090 inches.
12 linhas	" { 1 pollegada, thumb, or inch }	1·082 "
8 pollegadas	" 1 palmo or span	8·656 " or 0·7214 feet.
5 palmos	" 1 vara or yard	43·28 " 3·6067 "
2 varas	" { 1 braça or fathom }	86·56 " 7·214 "
The grao (of barley, in width) is 2 linhas		0·1803 inches
" dedo or finger	" 8 linhas	0·7213 "
" covada or cubit	" 3 palmos	25·968 " or 2·164 feet

The commercial covada measures 27 inches.

The Portuguese mile is 1·2786 miles English.

To reduce Portuguese palmos to English feet. Take $\frac{5}{7}$ ths and increase the same by its $\frac{1}{106}$ th part.

Surface.—The square palmo = 74·926 square inches or 0·5203 square feet.

The geira is 4840 square vara = 62959 square feet or 1·4453 acres.

Liquid Capacity.

		LISBON.	OPORTO.	
4 quartilhos	make 1 canada	0·3034	0·46	
6 canadas	" { 1 pote, cantaro, or alqueire }	1·8202	2·76	} gallons.
2 potes	" 1 almüde	3·6405	5·52	

The almüde of { Lisbon = 3·6405 } imperial gallons. 
 { Oporto = 5·5200 }

Dry Capacity.

			ENGLISH VALUE.	
			LISBON.	Oporto.
8 outavas	make 1 alqueire		0·3720	0·4696
4 alqueires	„ 1 fanga		1·4878	1·8782
15 fangas	„ 1 moio		22·317	28·173
			} bushels.	

The fanga of $\left. \begin{array}{l} \text{Lisbon} = 1·4878 \\ \text{Oporto} = 1·8782 \end{array} \right\}$ imperial bushel.

Timber is measured in cubic polegadas ; masonry in cubic palmas ; earthwork in cubic braças.

A cubic palmo = 648·56 cubic inches or 0·37532 cubic foot.

Weight.

24 graos	make 1 scropulo	18·45 grains.
3 scropulos	„ 1 outava	55·34 „
8 outavas	„ 1 onça	442·69 „
16 onça	„ 1 arratel or pound	7083 „ or 1·01186 lb.
32 arratels	„ 1 arroba	32·3795 lbs.
4 arrobas	„ 1 quintal	129·518 „

Gold and silver are weighed by the marco of 8 onças ; and medicines are weighed by a libra of 12 onças = $\frac{2}{3}$ arratel.

In Portugal the measures and weights are now those of the metric system ; see France, p. 75.

Money.

1 vintem	=	20 reas	1·1 pence sterling.
1 testoon	=	100 „	5·6 „ „
1 patàca	=	320 „	17·9 „ „
1 crusàdo	=	400 „	22·4 „ „
1 sello or new crusàdo	} =	480 „	26·9 „ „

Money.

20 reals vellon or } make { 1 duro, piastre, } (50*d.* sterling).
 10½ reals of plate } { or hard dollar }

The reals are each of them divided into 34 *maravedises*.

The legal money of Spain is founded on the reals vellon which are now more commonly divided into 10 *decimas* or 100 *centenas*.

The Spanish dollar is by law also divided into 100 cents.

The gold pistole is estimated at 15*s.* 11*d.* sterling.

„ „ doubloon „ „ 65*s.* 10*d.* „

The metric system of measures, weights, and decimal system of moneys is now adopted. See France, p. 75.

Stockholm; see Sweden and Norway.

Strasbourg; see Germany.

SWEDEN AND NORWAY.

Length.

	ENGLISH VALUE.
12 linies make 1 tum	0·9742 inches.
12 tums „ 1 fot	11·6904 „ or 0·9742 foot.
2 fots „ 1 aln	23·3808 „ 1·9484 „
3 alns „ 1 famn	5·8452 feet.
The stång is 8 aln	15·5872 „
The mil „ 6000 famn	11630 yards or 6·6423 miles.

The fot is now decimally divided.

Liquid Capacity.

4 jungfrus make 1 quarter	0·5756 pints.
4 quarters „ 1 stop	2·3024 „
2 stops „ 1 kanna	4·6048 „ or 0·5756 gallon.
48 kannas „ 1 tunna	27·6288 gallons.

Dry Capacity.

4 orts make 1 quarter	0·0090 bushels.
4 quarters „ 1 stop	0·0360 „
2 stops „ 1 kanna	0·0720 „
7 kannas „ 1 fjerding	0·5038 „
4 fjerdings „ 1 spann	2·0150 „
2 spanns „ 1 tunna of } 32 kappe }	4·0300 „ or 0·5038 „

Weight (Commercial).

The smallest denomination of weight in Sweden is the as
= 0·7418 English grain.

		ENGLISH VALUE.
4 qwintin	make 1 lod	205·1 grains.
2 lods	„ 1 untz	410·2 „
16 untzs	„ 1 skälpund } = 8848 as	6563·2 „ or 0·9376 lb.
The lispund	is 20 skälpunds	18·752 lbs.
The skeppund	is 400 skälpunds	375·040 „

Weight (Gold and Silver).

4 qwintin	make 1 lod	203·2 grains or 0·4234 oz. troy.
2 lods	„ 1 untz	406·5 „ 0·8469 „ „
8 untzs	„ 1 mark } = 4384 as	3252 „ 6·7750 „ „

Apothecaries' Weight.

20 grains	make 1 scrupel	19·1 grains or 0·0398 oz. troy.
3 scrupels	„ 1 drachma	57·3 „ 0·1194 „ „
8 drachmas	„ 1 untz	458·4 „ 0·9550 „ „
12 untzs	„ 1 skälpund } = 7416 as	5501 „ 11·4604 „ „

Money.

12 runstycken	make 1 skilling	1·1d. sterling.
48 skillings	„ 1 riksdaler } (silver specie)	53d. „
The gold ducat		9s. 2d. „

The riksdaler banco is only $\frac{2}{3}$ the above value.

In Norway the riksdaler is divided into 120 skillings.

The measures, weights, and currency of Sweden and Norway are since 1875 established on the decimal system. The monetary basis is now the following:—

Money.

100 öre	make 1 riksdaler	1s. 1·3d. sterling.
---------	------------------	---------------------

*The measures and weights, now in use, are those of the
ic system of France. See p. 75.*

The foot	=	23·028 inches or 1·9190 feet.
The ell	=	45·04 „ 3·7533 „

Liquid Capacity.

2 pots	make 1	quarteron	0·415 gallons.
24 quarterons	„	1 setter	9·954 „
12 setters	„	1 char	119·448 „

Dry Capacity.—The coupe (or sack) = 2·185 bushels.

Weight.

24 grains	make 1	denier	19·7 grains.
24 denier	„	1 unze	472·2 „ or 1·0704 lb
18 unzen	„	1 pfund	8500 „ 1·9

Money (same as France).—100 cents make 1 lira nuova (franc) ($9\frac{1}{4}$ d. sterling).

Since 1873 the measures and weights have been those of the metric system of France; see p. 75.

5. BASLE OR BÂLE.

Length.

		ENGLISH VALUE.	
The foot	=	11·74 inches	or 0·9783 feet.
The aune (large ell)		46·4	„ 3·8667 „
The brasse (small ell)		21·4	„ 1·7833 „

Liquid Capacity.

32 pott make 1 ohm		11 gallons.
3 ohm „ 1 saum		33 „

Dry Capacity.

2 becher make 1 köpflein		$\frac{1}{2}$ bushel.
32 köpflein „ 1 coupe or sack		$3\frac{1}{2}$ bushels.

Weight.

72 grains make 1 gros		59·4 grains.
8 gros „ 1 unze		475 „ or 1·0857 oz.
16 unzen „ 1 pfund		7600 „ 1·0857 lb.

Money.

100 raps make 1 Swiss frank		$13\frac{1}{2}$ d. sterling.
The silver crown		3s. 6d. „

Since 1873 the measures, weights, and moneys have been the same as those of France; see p. 75.

6. ST. GALLEN.

Length.

The ell for cloth	=	24·2 inches.
„ „ silks	=	31·6 „

Liquid Capacity.—The eimer (containing 32 mass)=11 gallons.

Dry Capacity.—The mütt (containing 4 viertel)=2·1 bushels.

Weight.

The heavy pound	=	9016 grains or 1·288 lb.
The light „	=	7175 „ 1·025 „

Money.—60 kreuzers make 1 florin or guilder (20 $\frac{1}{4}$ d. sterling).

Since 1873 the measures, weights, and moneys have been the same as those of France; see p. 75.

7. NEUFCHATEL.

		ENGLISH VALUE.
The foot	=	11·81 inches.
The ell	=	43·80 „

The French metric system is now adopted throughout Switzerland.

Toulon; see France.

Trieste; see Austria.

TRIPOLI (BARBARY).

Length.

The Turkish dreach or pik = 3 palmi, is 26·42 English inches.

The arbi dreach or lesser pic is 19·03 „ „

Liquid Capacity.—The barile=24 bozze, is 8956 cubic inches or 14·267 imperial gallons.

Dry Capacity.

2 nufs-orbah make 1 orbah	409·4 cubic in. or 0·1846 bushels.
4 orbahs „ 1 temen	1637·7 „ „ 0·7383 „
4 temen „ 1 ueba	6551 „ „ 2·9633 „

Weight.

16 kharoubas make 1 dram	48 grains.
10 drams „ 1 okie (oz.)	480 „ or 1 oz. troy.
16 okies „ 1 rottol	7680 „ 1 $\frac{1}{2}$ lb. „
100 rottols „ 1 cantar	109 $\frac{1}{2}$ lb. avoird. or 133 $\frac{1}{2}$ lbs. troy.

The metrical (for gold and silver) is 78·6 grains.

Money.

40 paras make 1 piastre	2 $\frac{1}{4}$ d.
20 piastres „ 1 mahhub	4s. 2d.

Turin; see Sardinia.

TURKEY.

Length.—The pic or pike is 26·8 inches.

Liquid Capacity.

The almud is 319·4 cubic inches or 1·152 imperial gallon.

The almud of oil should weigh 8 okes or 22 $\frac{1}{2}$ lbs. avoirdupois.

Dry Capacity.

The killow contains 2023 cubic inches or 0·912 bushel.

The fortin is 4 killows = 8092 cubic inches or 3·648 bushels.

The killow of rice is supposed to weigh 10 okes.

Weight.

UNITED STATES (NORTH AMERICA).

The weights and measures of the United States are precisely the same as those of Great Britain, with the exception of the measures of capacity, for which the old standards are still retained. Thus the unit of DRY CAPACITY is the old Winchester bushel = 2150·42 cubic inches = 7·75556 imperial gallons = 0·96944¹ imperial bushel.

Also the unit of LIQUID CAPACITY is the old Wine gallon = 231 cubic inches = 0·83311¹ imperial gallon.

Money.

Verona; see Venetian Lombardy.

Vienna; see Austria.

Warsaw (Poland); see Russia.

WEST INDIES.

The weights and measures are generally those of Great Britain.

Money.—100 cents make 1 dollar (50d. sterling). Pounds, shillings, and pence sterling are also used in accounts, the dollar being reckoned at the government par of 4s. 2d., as above, and the 16 dollar piece (Spanish onza), known as the doubloon, at 64s. sterling.

In most of the West India islands, a fixed valuation was established between the currency and nominal sterling, and the variations of exchange were effected by a per centage on the actual sterling, as at present in the Halifax currency. The legislature, in Jamaica, declared, in 1838, that 166l. 13s. 4d., Jamaica currency, should represent 100l. sterling, the same being in the proportion of 5 to 3, and the

Spanish coinage was regulated accordingly. The late currencies have, however, been abolished in all the islands.

The British currency was established in Bermuda in 1842, and all existing contracts were directed to be settled at the rate of $1\frac{2}{3}\%$ currency per pound sterling, which corresponds with the rate of currency at Jamaica.

WÜRTEMBERG (GERMANY).

For apothecaries' weight, see Nürnberg.

For the new imperial measures, weights, and moneys, now in use, see Germany, p. 78.

Zurich; see Switzerland.

GENERAL TABLES.

IN reducing foreign measures to the corresponding values in other denominations, architects, engineers, and practical men generally, of different countries, often experience considerable perplexity, in consequence of the necessity of frequent and varied references, and the tediousness of arithmetical calculation. The following Tables are designed to simplify and expedite all such reductions. Table I. contains a list of the principal linear measures of the various countries, states, and cities throughout Europe, arranged in an alphabetical order. The names of the places occupy the first column, and the columns of figures on the right exhibit, to four places of decimals, the value of an unit of each respective measure, when estimated in English inches, English feet, Florence braccia, French metres, French piers, Napolitan palmi, Rhineland feet, Roman palmi, Venice feet, and Vienna feet. Thus, in the line opposite the "Ancona foot," we read that it is equivalent to 15.384 English inches, 1.2820 English feet, 0.6695 parts of a Florence braccio, 0.3908 parts of a metre, 1.2029 French feet, 1.4818 Napolitan palmi, or 1.2449 Rhineland feet, &c. Table II. shows the comparisons of square or superficial measures, on precisely the same plan as Table I.

The following examples will practically exemplify their use.

Example 1. Reduce 326 Bergamo linear feet to the corresponding measure in Rhineland feet.

In Table I., opposite to Bergamo foot, and under Rhineland feet, we see that a Bergamo foot is equal to 1.3896 Rhineland feet. Therefore, multiplying 1.3896 by 326, we get 453.0 for the required measure in Rhineland feet.

Example 2. Reduce 218.54 Frankfort feet into English feet.

Referring to Table I., opposite Frankfort foot, and in the second column under English feet, we observe that a Frankfort foot is equal to 0.9392 parts of an English foot. Therefore, multiplying 218.54 by 0.9392, the result is 205.25 English feet.

Example 3. Reduce 215.36 Malta square feet into Venice square feet.

In Table II., opposite Malta foot and under Venice feet, we take out 0.6656 for the parts of a Venice foot which are measured by one Malta foot. Consequently by multiplying 215.36 by 0.6656, the answer is 143.34 Venice superficial feet.

Example 4. Reduce 562.18 Palermo square palmi to English feet.

Referring to Table II., as before, we find a Palermo square palmo is equal to 0.6308 parts of an English square foot. Hence multiply 562.18 by 0.6308, and the required result is found to be 354.62 English square feet.

MEASURES OF TIME.

TIME, in the abstract, is truly measured by the space or distance described by a moving body or machine when the velocity of the same is sustained with perfect uniformity.

A **SOLAR DAY** is measured by the duration of a complete rotation of the earth round its axis with respect to the sun. The motion of the earth's rotation in space is uniform; but as it is here estimated with reference to the sun, it is affected by the movement of the earth in its orbit round the sun, the velocity of which is subject to a gradual acceleration and retardation, both on account of the ellipticity of the orbit and of the perturbations produced by the planets. To obviate this fluctuation, clocks are adjusted to an average or mean solar day, which is subdivided as follows:—

60 seconds	make	1 minute
60 minutes	„	1 hour
24 hours	„	1 day.

In astronomical reckoning the day is supposed to commence at noon, and is counted throughout the twenty-four hours.

In civil reckoning the day commences at midnight, and is divided into two equal portions of twelve hours each, called morning and evening.

A **WEEK** is a period of seven days, and has been in use amongst eastern countries to the remotest periods of antiquity. The English names of these days are Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, and Saturday.

A **SOLAR YEAR**, also called a tropical or civil year, is determined by a revolution of the earth in its orbit round the sun, estimated with respect to the sun and the equinox. *In ordinary phraseology it is the time in which the sun moves from the vernal equinox to the vernal equinox again*

and its average value, called a **MEAN SOLAR YEAR**, has been found by astronomers to be 365·24222 mean solar days, or 365 days 5 hours 48 min. 48 sec.

A **CALENDAR MONTH** is an interval varying from 28 to 31 days, and was probably first derived from the synodic revolution of the moon, or lunar month according to the periodical phases, the mean value of which period has been found to be 29·5305887 days, or 29 days 12 hours 44 min. 2·8 sec. The year is divided into twelve calendar months, each of which consists of an integral number of days, viz. :—

January	31 days
February	28 „
March	31 „
April	30 „
May	31 „
June	30 „
July	31 „
August	31 „
September	30 „
October	31 „
November	30 „
December	31 „

. 365 days.

A **BISSEXTILE YEAR**, frequently called *leap-year*, consists of 366 days, an additional day being intercalated in the month of February, which is then made 29 days. This is occasionally required for the purpose of adjusting the calendar, so that the course of the seasons and the labours of agriculture, which depend on the situation of the sun, shall be correctly indicated. Before the time of Julius Cæsar, the Roman calendar was in great confusion, and, guided by Sosigenes, his astronomer, he adjusted it by making every *fourth civil year* into a bissextile of 366 days. The *correction so made* is called the *Julian correction*, and the

length of a mean Julian year, or year of the Julian Calendar, is hence $365\frac{1}{4}$ or 365·25 days.

In the Ecclesiastical Calendar the intercalary day is placed between the 24th and 25th of February; in the Civil Calendar it is accounted the 29th.

THE GREGORIAN CALENDAR.

Independently of the gradual and progressive improvement in astronomical knowledge and astronomical data, the length of the mean Julian year was practically ascertained to be in excess of the actual mean solar or tropical year, which contains only 365·24222 days; and it was found that the vernal equinox, which, at the Council of Nice, in the year 325, was supposed to correspond to the 21st of March¹, after the lapse of about 1200 years, had retrograded to the 11th. To get rid of the accumulated error, and so restore the equinox to its supposed former place, Pope Gregory XIII., in 1582, directed ten days to be suppressed in the calendar, by calling the 5th of October the 15th for that year; and as the error of the Julian intercalation, according to the calculations of Aloysius Lilius, a celebrated astronomer and physician of Naples, was found to amount to about three days in 400 years, it was ordered that the intercalations on centenary years should thenceforward be omitted, excepting those which are multiples of 400. This important adjustment is usually called the *reformation of the calendar*, and it has since been adopted in almost all Christian countries, under the name of the *Gregorian Calendar*, or *New Style*, the Julian Calendar formerly in use being called the *Old Style*.

For the sake of distinctness we shall here state the Gregorian rule of intercalation.

1. For years that are not even centuries :

If the year, when divided by 4, leaves a remainder, such

¹ *There is some slight inaccuracy in this; but it is of no consequence.*

year is ordinary; if there be no remainder, the year is bissextile.

2. For years that are even centuries:

If the number of centuries, when divided by 4, leaves a remainder, the year is ordinary; if there be no remainder, it is bissextile.

Thus, 1857, 1858, 1859, 1861 are ordinary;
1856, 1860, 1864, 1868 are bissextile.

Also, 1900, 2100, 2200, 2300 are ordinary;
2000, 2400, 2800, 3200 are bissextile.

Hence every period of 400 years consists of
97 bissextile years or 35502 days,
303 ordinary „ 110595 „

146097 days;

and therefore, taking the 400th part of this number, an average or mean Gregorian year is 365·24250 days.

Now the actual value of the mean solar or tropical year is 365·24222 days, so that the Gregorian rule causes the year to be only 0·00028 day in excess, which will amount to a day in about 3600 years². This small error might be corrected by carrying the rule one step further and changing multiples of 4000 into ordinary years instead of bissextiles.

The Gregorian Calendar was immediately adopted in Denmark, France, Holland, Italy, Portugal, and Spain, as well as by Catholics in other countries. It was established in Germany and Switzerland in 1700, and was not adopted in Great Britain until the year 1752, no less than 170 years after its first formation.

The Act of Parliament passed in 1751, and is entitled “An Act for regulating the Commencement of the Year, and for correcting the Calendar now in use.” The preamble recites,

² *The Julian error* (0·00778 day in excess) amounts to a day in 123 years.

that according to the legal supputation in England, the year began on the 25th of March; that this practice had produced various inconveniences, not only from its differing from the usage of neighbouring nations, but also from the legal computation in Scotland, and from the common usage throughout the whole kingdom; that the Julian Calendar then in use had been discovered to be erroneous, by means whereof the vernal or spring equinox, which at the time of the General Council of Nice, A.D. 325, happened on the 21st of March, now fell on the 9th or 10th of that month; that this error was still increasing; that a method of correcting the calendar had been received and established, and was generally practised by almost all other nations of Europe; and that it would be of general convenience to merchants and others corresponding with foreign nations if the like correction were received and established in his Majesty's dominions. It was therefore enacted,

1. That throughout all his Majesty's dominions in Europe, Asia, Africa, and America, the supputation according to which the year of our Lord began on the 25th of March shall not be used after the last day of December, 1751, and that the 1st day of January next following shall be reckoned as the 1st day of the year 1752, and so in all future years.

2. That from and after the 1st day of January, 1752, the several days of each month shall go on and be reckoned and numbered in the same order, and the feast of Easter and other moveable feasts thereon depending shall be ascertained according to the same method, as they now are, until the 2nd of September, 1752; that the natural day next immediately following the 2nd of September, 1752, shall be called and reckoned as the *fourteenth* day of September, omitting the eleven intermediate nominal days of the common calendar; that the days which follow next after the said 14th of September shall be reckoned in numerical order from that day; and all public and private proceedings whatsoever after the 1st of January, 1752, were ordered to be dated accordingly.

3. That the several years of our Lord 1800, 1900, 2100, 2200, 2300, or any other hundredth years of our Lord which shall happen in time to come (excepting only every fourth hundredth year of our Lord, whereof the year 2000 shall be the first), shall not be deemed Bissextile or Leap-years, but shall be considered as common years, consisting of 365 days only; and that the years of our Lord 2000, 2400, 2800, and every other fourth hundredth year of our Lord, from the year 2000 inclusive, and also all other years of our Lord, which by the present supputation are considered bissextile or leap-years, shall for the future be esteemed bissextile or leap-years, consisting of 366 days.

4. That whereas according to the rule then in use for calculating Easter-day, that feast was fixed to the first Sunday after the first full moon next after the 21st of March; and if the full moon happens on a Sunday, then Easter-day is the Sunday after, which rule had been adopted by the General Council of Nice, A.D. 325; but as the method of computing the full moons then used in the Church of England, and according to which the table to find Easter prefixed to the Book of Common Prayer was formed, had become considerably erroneous, it was enacted that the said method should be discontinued, and that from and after the 2nd of September, 1752, Easter-day, and the other moveable and other feasts, were henceforward to be reckoned according to the Calendar, Tables, and Rules annexed to the Act, and attached to the Books of Common Prayer.

DIFFERENCE OF STYLE.—From 1582 to 1700 the difference of style continued to be 10 days; but 1700 being bissextile in the Julian Calendar and ordinary in the Gregorian, the difference of the styles from 1700 to 1800 was 11 days. The Julian leap-year 1800 was also ordinary in the Gregorian Calendar, and therefore the difference during the present century is 12 days. After 1900 it will be 13 days, and will *so continue till 2100*, because the year 2000 will be a leap-

year in both styles. Thus if c denote the number of completed centuries, the number of days' difference between the old and new styles, which has accumulated since the second century, will be correctly represented by the formula,

$$c - \left(\frac{c}{4}\right)_w - 2,$$

where w denotes the integral quotient of $\frac{c}{4}$, rejecting any fraction or remainder.

Hence the following table, the extension of which is evident without calculation :—

Date.	Difference.	Date.	Difference.
1500 to 1700	10 days	2900 to 3000	20 days
1700 „ 1800	11 „	3000 „ 3100	21 „
1800 „ 1900	12 „	3100 „ 3300	22 „
1900 „ 2100	13 „	3300 „ 3400	23 „
2100 „ 2200	14 „	3400 „ 3500	24 „
2200 „ 2300	15 „	3500 „ 3700	25 „
2300 „ 2500	16 „	3700 „ 3800	26 „
2500 „ 2600	17 „	3800 „ 3900	27 „
2600 „ 2700	18 „	3900 „ 4100	28 „
2700 „ 2900	19 „	&c.	&c.

The difference requires to be added to the day of the month according to the old style to deduce the same day in the new style, and *vice versâ*. Thus 1872, June 10, old style, is the same day as 1872, June 22, new style.

DOMINICAL LETTER.—The dominical or Sunday letter is one of the first seven letters of the alphabet, and is used for the purpose of determining the day of the week corresponding to any given date. In the Ecclesiastical Calendar the first letter A is placed opposite to the first day of the year or January 1, the second letter B is placed opposite the second day or January 2, and so on through the seven letters; after which they are in like manner repeated over and over again.

to the end of the year. Then the letter which falls opposite the first Sunday in the year will also fall opposite every following Sunday throughout the year, because the number of letters is the same as the number of days in the week. In ordinary years the letter so indicated is the dominical letter. But in bissextile or leap-years an interruption takes place in the order of the letters on account of the intercalary day, and it is made as a matter of convenience in chronological tabulations. As the intercalary day falls on the 24th of February, the 24th and 25th days are denoted by the same letter, so that after the 24th day of February the dominical letter goes back one place. In the Civil Calendar, however, according to which calculations are generally made, the intercalary day is supposed to be added at the end of February, so that the change of letter takes place on entering March.

As an ordinary year contains 365 days or 52 weeks and 1 day over, and a bissextile year contains 52 weeks and 2 days over, it is evident from the foregoing account that for a series of consecutive years the dominical letters stand in a retrograde order, and go back one letter after every ordinary year and two letters after a bissextile year, the first change in the latter case occurring at the intercalary day, and the second at the end of the year. Thus a bissextile or leap-year has always two dominical letters, one to be used before and the other after the intercalary day.

For any proposed year X of the Gregorian Calendar, at any near or remote period of time, let c denote the number of completed centuries and y the year of the current century, so that $X = 100c + y$; then the number of bissextile years, from the year 1 of the calendar up to the year X inclusive, will be $\left(\frac{X}{4}\right)_w - c + \left(\frac{c}{4}\right)_w$, and the dominical letter may be determined in the following manner:—

From the year 0 to the year $Y = 100c + y$ the total number of intervening years is Y , and, if ordinary and bissextile

years are separately enumerated, the numbers are, according to what precedes—

$$\text{Ordinary years} = Y - \left\{ \left(\frac{Y}{4} \right)_w - c + \left(\frac{c}{4} \right)_w \right\}$$

$$\text{Embolismic years} = \left(\frac{Y}{4} \right)_w - c + \left(\frac{c}{4} \right)_w$$

In passing from January 1 of the year 0 to January 1 of the proposed year Y , the advancement of the day of the week, consisting of one day for every ordinary year, and two days for every intervening bissextile year, is obviously—

$$= Y + \left\{ \left(\frac{Y}{4} \right)_w - c + \left(\frac{c}{4} \right)_w \right\} \quad \text{rejecting sevens}$$

$$= (100c + y) + \left\{ \left(\frac{100c + y}{4} \right)_w - c + \left(\frac{c}{4} \right)_w \right\} \quad \text{,,} \quad \text{,,}$$

$$= 124c + y + \left(\frac{y}{4} \right)_w + \left(\frac{c}{4} \right)_w \quad \text{,,} \quad \text{,,}$$

But as $\left(\frac{c}{4} \right)_w$ denotes the quotient and $\left(\frac{c}{4} \right)_r$ the remainder, when the number c is divided by 4, we have the relation

$$4 \left(\frac{c}{4} \right)_w = c - \left(\frac{c}{4} \right)_r$$

$$\text{Therefore, } \left(\frac{c}{4} \right)_w = 2c - 2 \left(\frac{c}{4} \right)_r, \text{ rejecting sevens,}$$

$$\text{Similarly, } \left(\frac{y}{4} \right)_w = 2y - 2 \left(\frac{y}{4} \right)_r \quad \text{,,} \quad \text{,,}$$

Hence, by substitution, the advancement of the day of the week, or the number by which the dominical letter has retrograded, is

$$L_0 - L = 126c + 3y - 2 \left(\frac{c}{4} \right)_r - 2 \left(\frac{y}{4} \right)_r, \text{ rejecting sevens,}$$

$$= * 3y - 2 \left(\frac{c}{4} \right)_r - 2 \left(\frac{y}{4} \right)_r \quad \text{,,} \quad \text{,,}$$

The value of the sought number L is therefore

$$\begin{aligned} L &= 2\left(\frac{c}{4}\right)_r + 2\left(\frac{y}{4}\right)_r - 3y + L_0 \text{ rejecting sevens} \\ &= 2\left(\frac{c}{4}\right)_r + 2\left(\frac{y}{4}\right)_r + 4y + L_0 \quad \text{,,} \quad \text{,,} \\ &= 2\left(\frac{c}{4}\right)_r + 2\left(\frac{y}{4}\right)_r + 4\left(\frac{y}{7}\right)_r + L_0 \quad \text{,,} \quad \text{,,} \end{aligned}$$

It will be observed that sevens are rejected in this investigation because they do not alter the day of the week, and that sevens may be added to negative numbers for a like reason.

The letter L denotes the number that indicates the ordinal position in which the dominical letter stands in the alphabet. Similarly L_0 denotes the corresponding ordinal number for the year 0. Thus $L_0 - L$ determines how much the dominical number or dominical letter has retrograded through the entire period, that is, after sevens have been freely rejected from the result.

The number L_0 refers to a given year, and is, therefore, a constant. It will be requisite to ascertain its value in order to finally adapt the foregoing formula to direct calculation. Before proceeding to do so it may be well to observe by way of explanation of the object attained by the preceding deductions, that the terms of the expression have been severally put in the form of remainders, so as to simplify the computation as much as possible by the exclusive use of very small numbers.

By testing the last expression with any given year for which L is known, it is found that the constant $L_0 = 1$. Therefore the dominical letter for any year, $Y = 100c + y$, in the Gregorian Calendar may always be found from the simple and general formula,

$$L = 2\left(\frac{c}{4}\right)_r + 2\left(\frac{y}{4}\right)_r + 4\left(\frac{y}{7}\right)_r + 1 \text{ (rejecting sevens);}$$

where the small letter *r* is placed to indicate that it is the *remainder* of each division that enters into the calculation. The resulting number *L* may be called the *dominical number*, as it will indicate the numerical order of the required letter.

Thus if <i>L</i> be	1	2	3	4	5	6	7
The letter will be	A	B	C	D	E	F	G

If the proposed year be bissextile, the letter so calculated will be the second letter of the year, or that which applies after the intercalary day in February.

The preceding formula may be put down in the following rule:—

Rule.—Divide the number of centuries by 4; the years of the current century by 4, and the same by 7: put down the three remainders; multiply them respectively by 2, 2, 4; add together the three products with an additional unit, and the sum after rejecting sevens, if necessary, will be the dominical number, or the ordinal number in which the dominical letter stands in the alphabet.

Example.—Required the dominical letter for the year 1942. The centuries are here 19, and the years of the current century 42; the three remainders are therefore 3, 2, 0; the three products are 6, 4, 0; which added together with an additional unit give 11; therefore rejecting 7, the ordinal number of the required letter is 4; it is therefore D, the fourth letter of the alphabet.

The dominical letter or letters of any proposed year may be obtained, by inspection, from the following table, to which an auxiliary table is added, showing the means by which the dominical letter is made to indicate the day of the week answering to any given date.

PERPETUAL TABLE OF DOMINICAL LETTERS.

Year of the Current Century (y).				Completed Centuries (c).			
				$\left(\frac{c}{4}\right)_r = 1$	$\left(\frac{c}{4}\right)_r = 2$	$\left(\frac{c}{4}\right)_r = 3$	$\left(\frac{c}{4}\right)_r = 0$

CYCLE OF THE SUN.—As the number of dominical letters, or days in the week, is seven, and as every fourth year is bissextile or leap-year, the same order of dominical letters for a specified year of the Julian Calendar only returns after 4 times 7, or 28 years, which is the period of the solar cycle. The cycle is considered as having commenced nine years before the era, so that the number or year of the cycle corresponding to any year Y of the Julian Calendar, is determined by the formula,

$$s = \left(\frac{Y + 9}{28} \right)_r,$$

which may be stated in the following rule:—

Rule.—Add 9 to the given year; divide the sum by 28;

the quotient is the number of cycles elapsed, and the remainder is the number or year of the cycle: if there be no remainder, the number is 28, the last of the current cycle.

If preferred, the calculation may be modified thus:—

Second Rule.—Having, as before, added 9 to the year, divide by 4, and the integral quotient again by 7; then the first remainder added to 4 times the second remainder will give the number of the solar cycle. If there be no remainder to either division, the required number is 28.

Example.—Required the number of the solar cycle for the year 1942.

The year, augmented by 9, is 1951.

1951, divided by 4, gives 487, with first remainder 3;

487 „ 7 „ 69 „ second „ 4;

and adding 3 to 4 times 4, the number of the solar cycle is 19.

Otherwise the solar cycle may perhaps most conveniently be deduced by subtracting from the given year the next less number contained in the following formula:—

Cycle (*s*) = year — (1811, 1839, 1867, 1895, 1923, 1951,
1979, 2007, 2035, 2063, 2091, &c.).

The cycle of the sun, or more properly the *Sunday cycle*, was invented for the purpose of determining the dominical letter or letters for any given year of the Julian Calendar, by means of a short and convenient table exhibiting the same for each of the 28 years of one cycle.

But according to the Gregorian Calendar now in general use in every Christian country, with the exception of Russia, the order of the letters is necessarily interrupted by the first suppression of a centenary leap-year, and the table of dominical letters must therefore, after every such year, be reconstructed for the next following century. We have, however, found, page 140, that the complete intercalary period of 400 Gregorian years consists of 146,097 days

As this number is divisible by 7 without a remainder, and therefore comprises exactly 20,871 weeks, it follows that the same order of dominical letters and days of the week will recur after this period of 400 years, which is therefore the complete Sunday cycle of the Gregorian Calendar. The purport of these remarks may perhaps receive further elucidation from an examination of the perpetual table of dominical letters already given, which extends through a complete cycle of 400 years, and will therefore in future calculations supersede the use of the solar cycle.

GOLDEN NUMBER.—The cycle of the moon or lunar cycle, sometimes called the Metonic cycle, after the name of its original inventor, Meton, is a period of *nineteen* years, after which the new moons fall on the same days of the Julian year, within an hour and a half. The number which any given year occupies in the current cycle was called the *golden number*, from the circumstance of its being usually marked in letters of gold in ancient calendars, and it was used for the purpose of determining the days of new moon, and of thereby fixing the date of Easter-day, on which the other moveable feasts of the ecclesiastical calendar are made to depend. The year of the birth of our Saviour is reckoned the first of the lunar cycle, and therefore the golden number for any year *X* is determined by the formula,

$$g = \left(\frac{X + 1}{19} \right)_r$$

which may be expressed by the following rule:—

Rule.—Add 1 to the year; divide the sum by 19; the quotient is the number of completed cycles, and the remainder is the golden number. If 0 remains, the number is 19, the year being in that case the 19th or last of the cycle.

By this rule the following table has been calculated, and the golden number for any proposed year can be taken from it by inspection.

As the lunar months in the construction of the calendar must necessarily be estimated in integral days, and as the mean value of the lunar synodical month is over $29\frac{1}{2}$ days, it is evident that the calendar lunations must consist mainly of 30 and 29 days alternately, but that on the whole there should be rather more of the former than the latter. Now 19 ordinary years of 365 days make 6935 days; these are distributed into 235 calendar lunations in the following manner.

The lunations are made to consist of 30 and 29 days alternately, so that each lunar year of 12 lunations thus

18	37	56	75	94		7	12	17	3	8	13	18	4	9

comprises 354 days, which is 11 days short of the ordinary calendar year of 365 days. To correct this accumulating deficiency, 6 embolismic months of 30 days each are introduced in the course of the cycle of 19 years, and one of 29 days is added at the termination of the cycle. In this way the 235 lunations become divided thus:

120	calendar lunations of	30	days =	3600	days
115	" "	29	" =	3335	"
<u>235</u>	" "	30 and 29	" =	6935	days.

Furthermore, in every bissextile year the intercalary day is also added to the days of the lunation in which it happens to be included, making the same 30 instead of 29 days, so that the 235 lunations thus distributed will then accurately measure 19 Julian years. Thus, as the intercalary day of the Julian Calendar occurs uniformly once in every four years without interruption, the average number of such days, distributed in periods of 19 years, will be $4\frac{3}{4}$ days, which, added to the 6935 days, give $6939\frac{3}{4}$ days for the mean value of the entire cycle so formed, and this is exactly equal to 19 mean Julian years of $365\frac{1}{4}$ days.

There are two objections, in point of accuracy, to the permanency of this lunar-solar period. In the first place, the Julian year, employed as the basis of calculation, does not correctly represent either the mean solar or the Gregorian year; as compared with the latter, the accumulated error after any stated epoch will be represented by the augmentation of the requisite correction for reducing the old to the new style. In the second place, the period of $6939\frac{3}{4}$ days is nearly an hour and a half in excess of 235 mean astronomical lunations, and therefore the correct time of new moon will in successive cycles happen so much earlier, and will retrograde a day in every 308 years. For the purpose of correcting and adjusting the errors whenever they amount to one day, by an established system of calculation, Lilius introduced another set of numbers called Epacts.

EPACT.—The epact for any year is a number designed to represent the age of the moon on the first day, that is, on the 1st day of January, of that year.

Suppose, for the first year of a lunar cycle, a new moon to happen on the 1st day of January; then the age on the day of new moon being 0, the epact for that year will be 0. Now the civil year containing 365 days, and the lunar year only 354 days, the new moon will at the end of the year have *retrograded 11 days*, and this will be the same if the civil

year be a bissextile of 366 days, because in that case the intercalary day is also included in the lunations, causing the lunar year to consist of 355 days. It therefore follows that the moon's age on the 1st of January of the second year of the cycle, or the epact of the second year, will be 11 days. Similarly the epact for the third year will be 22 days. Another addition of 11 would give 33 for the fourth year; but in consequence of the insertion of the embolismic month of 30 days, the epact for the fourth year is reduced to 3. In like manner the epacts of the following years are deduced by successively adding 11 and rejecting 30 whenever the sum exceeds that number, excepting at the termination of the cycle, where the last embolismic month being only 29 days, the same number is deducted, and we again have 0 for the epact of the first year of the next cycle. The order of the epacts throughout each cycle is therefore as follows:—

Year of the Cycle, or Golden Number (<i>g</i>).																		
1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19
*	11	22	3	14	25	6	17	28	9	20	1	12	23	4	15	26	7	18
Epact (<i>e</i>).																		

This table will exhibit the epacts correctly from the year 1700 to the year 1900, the mathematical relations being,

$$g = \left(\frac{Y + 1}{19} \right)_r, \quad e = \left(\frac{11(g - 1)}{30} \right)_r.$$

But it has been explained under the article *Golden Number*, that in the course of centuries the astronomical new moon will deviate from the preceding deductions, from two causes, viz. the small error of the cycle of 235 calendar lunations as compared with 235 mean astronomical lunations, and the gradual shifting of dates on account of the difference between the *Julian* and *Gregorian* styles. We now proceed to in-

investigate the principles on which these irregularities are calculated and adjusted.

To determine the error on account of the inaccurate measure of the lunations, we have

$$\begin{array}{rcl}
 19 \text{ mean Julian years, } & \left. \begin{array}{l} \text{each } 365.25 \text{ days} \end{array} \right\} & . . \quad 6939.75 \quad \text{days} \\
 235 \text{ astronomical lunations, } & \left. \begin{array}{l} \text{each } 29.5305887 \text{ days} \end{array} \right\} & 6939.68834 \quad , , \\
 & & \hline
 & & 0.06166 \text{ day.}
 \end{array}$$

The excess of the established period of the lunar cycle or the Julian Calendar over the astronomical lunations is therefore 0.06166 day, or about 1 h. 28.8 min. Thus after every cycle of 19 years the times of new moon will happen 1 h. 28.8 min. earlier than in the preceding cycle, and therefore the age of the moon will become periodically *increased* by the same quantity, which will amount to a day in about 308 years. In the construction of the calendar it has been assumed to amount to 8 days in 25 centuries, and, when computed from the year 1700, to be determined by the formula,

$$a = \left(\frac{c - 17}{25} \right)_w, \text{ correction} = \left(\frac{c - a}{3} \right)_w - 5.$$

Thus after a period of 25 centuries,

$$\begin{array}{rcl}
 c & \text{will be augmented by } 25, \\
 a & , , , , 1, \\
 c - a & , , , , 24;
 \end{array}$$

therefore the correction $\left(\frac{c - a}{3} \right)_w - 5$ will give exactly 8 days in every 25 centuries, and this reduces the lunar error to less than a day in 270,000 years.

To obtain the correction on account of difference of style, if c , as before, denote the number of completed centuries in the proposed year X , we have ascertained that the number of days' difference between the old and new styles will then

have amounted to $c - \left(\frac{c}{4}\right)_w - 2$. When $c = 17$ it is 11 days for the year 1700; therefore, from 1700 to the given year Y , the divergence on account of style will be $c - \left(\frac{c}{4}\right)_w - 13$, and the age of the moon or epact for the year will thereby be *diminished* by the number of days represented by this last formula, which expresses, in fact, the number of centenary years passed over that are not made bissextile.

For the complete correction of the epact or moon's age, is will hence be requisite to add $\left(\frac{c-a}{3}\right)_w - 5$, and to subtract $c - \left(\frac{c}{4}\right)_w - 13$, or to apply the difference of these corrections, viz. $8 + \left(\frac{c}{4}\right)_w + \left(\frac{c-a}{3}\right)_w - c$. Thus in the new style or Gregorian Calendar, the general formulæ for determining the epact for any year Y are

$$\begin{aligned} a &= \left(\frac{c-17}{25}\right)_w \\ e &= \epsilon + 8 + \left(\frac{c}{4}\right)_w + \left(\frac{c-a}{3}\right)_w - c \\ &= \left(\frac{11(g-1)}{30}\right)_r + 8 + \left(\frac{c}{4}\right)_w + \left(\frac{c-a}{3}\right)_w - c. \end{aligned}$$

Should the calculation of this expression come out negative, an embolismic month of 30 days must be added.

Note.—Should the result be $\frac{24}{25}$, change it into $\frac{25}{26}$ when over the golden number exceeds 11.

Example.—Required the epact for the year 1942.

Here $Y = 1942$ and $c = 19$.

$Y + 1 = 1942 + 1 = 1943$, which on being divided by 19 leaves as remainder the golden number $g = 5$.

$11(g-1) = 11 \times 4 = 44$, which divided by 30 leaves as remainder $\epsilon = 14$.

$c - 17 = 2$, which divided by 25, the whole number of the quotient is $a = 0$: (this will always be 0 until the year 4200.)

$$\text{Therefore the required epact} = \varepsilon + 8 + \left(\frac{c}{4}\right)_w + \left(\frac{c-a}{3}\right)_w - c = 14 + 8 + 4 + 6 - 19 = 13.$$

By first taking out the golden number from the table, page 158, the epact for any given year may be obtained by inspection from the following table, in the column under the completed centuries.

TABLE OF EFACTS.

NUMBER OF DIRECTION.—The number of direction is the number of days that Easter-day falls later than the 21st of March. Easter, as ordained by the Council of Nice, is the *1st Sunday after the first full moon which happens upon or*

next after the 21st day of March; and if the full moon happens on a Sunday, then Easter-day is the Sunday after. This last condition was introduced to avoid the celebration of Easter at the same time as the Jewish Passover; notwithstanding which, this coincidence will sometimes happen, and will next occur in the year 1903. The moon on which Easter immediately depends is called the *paschal moon*, and the full moon is defined to be the 14th day of the moon, that is, 13 days after the preceding day of new moon.

Now the epact, e , is the age of the moon on January 1; and therefore January $(31 - e)$ is a day of new moon. And as the months January and February together comprise the same number of days as two alternate lunations of 29 and 30 days, it follows that March $(31 - e)$ must likewise be a day of new moon. Adding 13 days, the 14th day of this moon will fall on March $(44 - e)$, and this will be upon or later than the 21st day of March, and therefore be the paschal full moon, provided e be less than 24. When e is 24 or greater than 24 the next following moon will be the paschal moon, and the date so found will require to be increased by 29 or 30 days respectively as the period of the current lunation. The reason of this distinction is, that the epacts 24 and 25 are made to occupy the same day in the calendar whenever the lunation is required to pass from 29 to 30 days, which is the case in April. The number of days from March 21 to the day of the paschal full moon, which for uniformity we shall designate the *Paschal Direction* and denote by P , is therefore thus determined:—

When $e < 24$, $P = 23 - e$;

„ $e = 24$, $P = 28$;

„ $e > 24$, $P = 53 - e$.

Next, to find the Sunday following the paschal full moon, if L denote the dominical number, $L + 4 + 7m$ days after March 21 will be a Sunday, and the number of days which intervene between the day of the paschal full moon and this

Sunday will be $L + 3 + 7m - P$. Therefore the number of days which intervene between the paschal full moon and the immediately following Sunday, or Easter, will be the least positive remainder of $L + 3 + 7m - P$ when divided by 7; and, denoting these intervening days by p ,

$$\text{when } P = 23 - e, p = \left(\frac{L + e + 7m - 20}{7} \right)_r = \left(\frac{L + e + 1}{7} \right)_r,$$

$$,, \quad P = 28, \quad p = \left(\frac{L + 3}{7} \right)_r$$

$$,, \quad P = 53 - e, p = \left(\frac{L + e + 7m - 50}{7} \right)_r = \left(\frac{L + e - 1}{7} \right)_r.$$

Hence if N be the number of direction, $N = P + 1 + p$, and we obtain the following general formulæ for its computation:—

$$\text{When } e < 24, N = 24 - e + \left(\frac{L + e + 1}{7} \right)_r$$

$$,, \quad e = 24, N = 29 \quad + \left(\frac{L + 3}{7} \right)_r$$

$$,, \quad e > 24, N = 54 - e + \left(\frac{L + e - 1}{7} \right)_r.$$

Example.—Find by calculation the number of direction for the year 1942.

The dominical number, page 145, has been found to be $L = 4$; and, page 156, the epact to be $e = 13$

Therefore, e being less than 24,

$$\begin{aligned} N &= 24 - e + \left(\frac{L + e + 1}{7} \right)_r \\ &= 24 - 13 + \left(\frac{4 + 13 + 1}{7} \right)_r \\ &= 11 + \left(\frac{18}{7} \right)_r = 11 + 4 = 15. \end{aligned}$$

This calculation however may in all cases be dispensed with by entering the following table with the epact and dominical letter.

*Perpetual Table for finding the NUMBER OF DIRECTION (N)
from the Epact and Dominical Letter.
(For Leap Years use the second letter.)*

EASTER-DAY.—The date of Easter-day is obtained by simply adding the number of direction to March 21. It is herefore March ($N + 21$), or April ($N - 10$); and b

employing the foregoing values of N we deduce the following formulæ for its determination:—

When $e < 24$, Easter is $\left\{ \begin{array}{l} \text{March } (45 - e) \\ \text{April } (14 - e) \end{array} \right\} + \left(\frac{L + e + 1}{7} \right)_r$,

„ $e = 24$, „ „ April $19 + \left(\frac{L + 3}{7} \right)_r$,

„ $e > 24$ „ „ April $(44 - e) + \left(\frac{L + e - 1}{7} \right)_r$.

By entering the following table with the epact and the dominical letter the date of Easter-day may always be ascertained by inspection.

Perpetual Table for determining EASTER-DAY from the Epact and Dominical Letter.

Epact (e).	Dominical letter. (For Leap Years use the second letter.)

INDICTION.—The Roman Indiction is a mode of measuring time by a cycle of 15 years, formerly used by the Romans for some time after the Emperor Constantine, but the precise time of its first adoption has not been ascertained with certainty, beyond the fact that the year 313 of the Christian era was a first year of a cycle of indiction.

To find the indiction, we must therefore observe the following rule :—

Rule.—Add 3 to the year ; divide the sum by 15, and the remainder will be the Indiction. If there be no remainder, the Indiction is 15. Or divide the sum by 30, and diminish the remainder by 15 if greater than 15.

DIONYSIAN PERIOD.—The Dionysian is a period of 532 years, formed from the product of the lunar cycle 19 and the solar cycle 28, and invented by Dionysius Exiguus about the time of the Council of Nice, to include all the varieties of the new moons and dominical letters ; so that after every 532 years they were expected to recur in the same order. This would have been very convenient for fixing the date of Easter and of the other days of the calendar by a table calculated for the years of one cycle ; but as the measure of the lunar cycle was supposed to be exact, which is not the case, and as the Sunday cycle is now interrupted at the centenary years that are not bissextile, the Dionysian period is no longer used in such calculations.

To find the year of the Dionysian Period :—

Rule.—Add 457 to the year of Christ ; divide the sum by 532, and the remainder will be the number required. Or for any year, from the present time up to the year 2208,

$$\begin{aligned}\text{Year of the Dionysian} &= 129 + (\text{Year} - 1800), \\ &\text{or} = \text{Year} - (1671, 2128, \&c.).\end{aligned}$$

When divided by 28 the remainder is the solar cycle ; when divided by 19 the remainder is the lunar cycle or golden number.

JULIAN PERIOD.—The Julian Period is a large cycle of 7980 years, formed by multiplying together the lunar cycle of 19 years, the solar cycle of 28, and the indiction of 15, and its commencement goes back 4714 years beyond the Christian era.

To determine the number for any year.

Rule.—Add 4713 to the given year; divide the sum by 7980; the remainder will be the year of the Julian Period. Or for any year from the present time up to the year 3267,

$$\text{Year of the Julian Period} = 6513 + (\text{Year} - 1800).$$

If the year of the Julian Period be divided by 19, the remainder will be the *golden number*; if it be divided by 28, the remainder will be the *solar cycle*; and if it be divided by 15, the remainder will be the *indiction* for the corresponding year. Also, if it be divided by 532, the remainder will be the year of the Dionysian.

MOON'S AGE.—The age of the moon on any given date may be approximately deduced by adding to the epact the day of the month and the number below for the month, rejecting 30's if necessary.

Jan.	Feb.	Mar.	Apr.	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.
0	1	0	1	2	3	4	5	7	7	9	9

MOVEABLE FEASTS.—These are in general made to depend on the date of Easter-day. The following are some of the principal Sundays:—

Septuagesima Sunday	is	9	} weeks before Easter.
Shrove Sunday	"	7	
1 Sunday in Lent	"	6	
Midlent Sunday	"	3	
Rogation Sunday	is	5	} weeks after Easter.
Whit-Sunday	"	7	
Trinity Sunday	"	8	

Advent Sunday is the nearest Sunday to November 30, whether before or after.

Also,

First day of Lent is 3 days after Shrove Sunday.

Good Friday „ 2 „ before Easter.

Ascension-day „ 4 „ after Rogation Sunday.

The number of days which *intervene* between Epiphany (January 6) and Septuagesima Sunday is $10 + N$ in ordinary years, and $11 + N$ in bissextile years, N denoting the number of direction. Therefore, as the Epiphany Sundays are included in this interval,

$$\text{Sundays after Epiphany} = \left(\frac{10 + N}{7}\right)_w \text{ in ordinary years}$$

$$\text{„ „ „} = \left(\frac{11 + N}{7}\right)_w \text{ „ bissextile „}$$

Also the number of days *intervening* between Trinity Sunday and November 27, the earliest possible date of Advent Sunday, $= 194 - N$. Therefore,

$$\begin{aligned} \text{Sundays after Trinity} &= \left(\frac{194 - N}{7}\right)_w \\ &= 22 + \left(\frac{40 - N}{7}\right)_w. \end{aligned}$$

To determine the elements of the Christian calendar, for any given year, it is only requisite to take out, by inspection,

the Dominical Letter	from the table,	page 146
„ Golden Number	„ „ „	150
„ Epact	„ „ „	156
„ Number of Direction	„ „ „	159

When the number of direction has thus been ascertained, the *moveable feasts* and other articles of the calendar will be shown by the following tables.

Table of the MOVEABLE FEASTS, &c., according to the Number of Direction.

1830. The following is an abstract of clause vi. of the Act:—
"Hilary Term shall begin on the 11th and end on the 81

day of January; Easter Term shall begin on the fifteenth day of April, and end on the eighth day of May; Trinity Term shall begin on the twenty-second day of May, and end on the twelfth day of June; and Michaelmas Term shall begin on the second and end on the twenty-fifth day of November; and that the Essoign and General Return Days of each Term shall, until further provision be made by Parliament, be as follows; that is to say, the first Essoign or General Return day for every Term shall be the fourth day before the day of the commencement of the Term, both days being included in the computation; the second Essoign day shall be the fifth day of the Term; the third shall be the fifteenth day of the Term; and the fourth and last shall be the nineteenth day of the Term, the first day of the Term being already included in the computation; with the same relation to the commencement of each Term as they now bear, and shall be distinguished by the day of the Term on which they respectively fall, the Monday being in all cases substituted for the Sunday when it shall happen that the day would fall on Sunday, except always that in Easter Term there shall be but four Returns instead of five, the last being omitted; provided that in case the day of the month on which any Term according to the Act aforesaid is to end shall fall to be on a Sunday, then the Monday next after such day shall be deemed and taken to be the last day of the Term; and that if the whole or any number of the days¹ intervening *between the Thursday before and the Wednesday next after Easter-day* shall fall within Easter Term, there shall be no Sittings in Banc on any of such intervening days, but the Term shall in such case be prolonged and continue for such number of *days of business* as shall be equal to the number

¹ The intervening days, exclusive of Easter-day, are

Good Friday,
Saturday,
Easter Monday,
Easter Tuesday.

of the intervening days before mentioned exclusive of Easter-day, and the commencement of the ensuing Trinity Term shall in such case be postponed and its continuance prolonged for an equal number of *days of business*."

The wording of the Act is somewhat confused and obscure, and its correct interpretation and practical application require some little consideration. In order to obviate this inconvenience, as these terms are not yet entirely obsolete, we annex the following table, in which the dates of the commencement and ending of the several terms are made to depend simply on the Number of Direction.

Table of the OLD LAW TERMS, according to the Number of Direction.

No. of Direction (<i>N</i>).	Name.	Begins.	Ends.	No. of days.

LAW SITTINGS.—On the 1st of November, 1875, the Judicature Act, 1878, came into force, and the division of the legal year into terms was abolished so far as relates to the administration of justice. The Rules of Court provide that there shall be four sittings in every year of the Court of **Land and High Court of Justice**, namely :—

1. MICHAELMAS SITTINGS, beginning November 2, ending December 21.
2. HILARY SITTINGS, beginning January 11, ending Wednesday before Easter.
3. EASTER SITTINGS, beginning Tuesday after Easter week, ending Friday before Whit Sunday.
4. TRINITY SITTINGS, beginning Tuesday after Whitsun week, ending August 8.

There are also Law Terms in use observed by the Inns of Court. These terms are—

Hilary.—Same as old Law Term, January 11 to January 31 or February 1.

Easter.—The first 28 days of the Easter Law Sitings.

Trinity.—The first 21 days of the Trinity Law Sitings.

Michaelmas.—Same as old Law Term, November 2 to November 25 or November 26.

UNIVERSITY TERMS.—The University Terms may also be obtained simply from the Number of Direction by means of the following formulary table :—

N.						Oxford Act.	Cambridge Commencement.
	2	9	16	23	30	July 1	June 17

Accession Chas. II.	.	.	.	.	.	.	May 29.
St. Barnabas	.	.	.	.	.	.	June 11.

MEASURES OF TIME.

The Act, *first* Tuesday in July.

Hilary.	Term begins Jan. 14	} ends Mar. 13 + N
	(if Sunday) Jan. 15	
Easter	Mar. 24 + N	} " May 7 + N
	(if $N=1,32$) Mar. 25 + N	
Trinity	May 8 + N	} " The Act + 4
	(if $N=21, 34$) May 10 + N	
Michaelmas	" Oct. 10	} " Dec. 17
	(if Sunday) Oct. 11	
		} " (if Sunday) Dec. 18

CAMBRIDGE UNIVERSITY TERMS.

Commencement, Tuesday *before* Midsummer.

Hilary	Term begins Jan. 13	ends Mar. 12 + N
Easter	" " Mar. 26 + N	" Comm. + 3
Michaelmas	" " Oct. 1	" Dec. 16
Hilary	Term divides	 Feb. 11 + $\frac{1}{2} N$
	(bis)	 Feb. 11 + $\frac{1}{2} (N+1)$
Easter	" divides	 May $\frac{1}{2} (N+Comm. - 1)$
Michaelmas	" " " " " " " "	 Nov. 8, noon.

To facilitate the construction of the Gregorian Calendar for any proposed year, the following table is inserted, showing the dominical letter, golden number, epact, number of direction, and Easter Sunday for three centuries, namely, from 1800 to 2100. It is only requisite to take the number of direction from the last column but one, and, with it, to enter the table on pages 172 and 173, and everything becomes immediately known without any calculation.

Elements of the GREGORIAN CALENDAR for Three Centuries, 1800 to 2100.

HEBREW CALENDAR.

A paper on the computation of the Hebrew Calendar was given by Mr. Herschell Fillipowski, in the "Lady and Gentleman's Diary," for the year 1850. As the Diary is out of print the following introductory extract may be acceptable:—

"Of all calendars known the Hebrew Calendar is the most complicated. It is the more remarkable on account of its astronomical system as laid down by the Hebrews, A.D. 358, and which, to the present time, agrees in its results with the revolutions of both luminaries.

"The Hebrew Calendar is composed either of twelve or thirteen months, the former being called a *common* the latter an *embolismic* year. The months receive alternately thirty and twenty-nine days; thus, in a common year the number of days amount to 354, whilst in an embolismic one they amount to 384; in both these cases they are called *reg-*

years. The month of intercalation is always the twelfth in the year, and invariably receives thirty days ; it is then called **ADAR THE FIRST**, whilst in a common year there is only one month of *Adar*.

“ The year begins with the month of **TISHRI**, it being the seventh in the year, and is fixed on or immediately after the day of the mean new moon of that month (which always takes place during the month of September), provided the new moon does not occur within the last six hours of the day (the day commences and terminates at 6 p.m.).

“ The new year is not to be fixed on either of the following days—Sunday, Wednesday, or Friday ; accordingly, if the new moon happens to take place on either of these three days, though within the first eighteen hours of the day, the new year is postponed respectively to the next following day. These regulations cause, occasionally, either the eighth month, *Heshvon*, to receive thirty days instead of twenty-nine, thus increasing the year with one day ; or the ninth month, *Kislev*, to receive twenty-nine days instead of thirty, by which the year is made one day shorter.

“ The time of one mean lunar revolution is assumed by the Hebrews to be 29 days, 12 hours, and $44\frac{1}{2}$ minutes, differing from the modern astronomers by only half a second. With this they have measured, without exception, all lunar months ever since the introduction of their calendar, the results of which seem to correspond closely with those of modern computation.”

The Jews date their Calendar from the Creation, which is considered by them to have occurred 3760 years and 8 months before the commencement of the Christian era. The year is luni-solar, and, according as it is ordinary or embolismic, consists of twelve or thirteen lunar months, each of which has 29 or 30 days. It is occasionally made a day more or less than the mean value in order that certain festivals may fall on proper days of the week for their due observance. **days of the** respective months, according to the number **rised in the** different years, are distributed as follows :—

Month.	Ordinary year.			Embolismic year.		
	Imperfect.	Common.	Perfect.	Imperfect.	Common.	Perfect.
Tisri	30	30	30	30	30	30
Hesvan	29	29	30	29	29	30
Kislev	29	30	30	29	30	30
Tebet	29	29	29	29	29	29
Sebat	30	30	30	30	30	30
Adar	29	29	29	30	30	30
(Veadar)	..	..	..	(29)	(29)	(29)
Nisan	30	30	30	30	30	30
Yiar	29	29	29	29	29	29
Sivan	30	30	30	30	30	30
Tamuz	29	29	29	29	29	29
Ab	30	30	30	30	30	30
Elul	29	29	29	29	29	29
No. of } days in } the year }	353	354	355	383	384	385

The intercalary month, Veadar, is introduced that Pass-over, the 15th day of Nisan, may be kept at its proper season, which is the full moon of the vernal equinox, or that which takes place after the sun has entered the sign Aries. The distribution of the embolismic years is determined by a cycle of 19 years, according to the following rule.

Divide the Hebrew year by 19, the quotient is the number of the last completed cycle, and the remainder is the year of the current cycle; should it be 3, 6, 8, 11, 14, 17, or 19 (0), the year is embolismic; if any other it is ordinary.

Or if Y denote the year, and

$$R = \left(\frac{7Y + 13}{19} \right)_r;$$

the year is embolismic when $R > 11$.

The calendar is constructed by assuming the mean lunation to be 29 days 12 hours 44 min. $3\frac{1}{2}$ sec., and that the year commences on, or immediately after, the new moon

following the autumnal equinox. The mean solar year is also assumed to be 365 days 5 hours 55 min. $25\frac{25}{7}$ sec.¹, so that a cycle of nineteen of such years contains 6939 days 16 hours 33 min. $3\frac{1}{2}$ sec., the exact measure of 235 of the assumed lunations. The year 5606 was the first of a cycle, and the computed new moon answering to the 1st of Tisri for that year was 1845, Oct. 1, 15h. 42m. $43\frac{1}{2}$ s., according to Lindo, adopting the civil mode of reckoning from the previous midnight. The future times of new moon are consequently deduced by successively adding 29 days 12h. 44m. $3\frac{1}{2}$ s. to this date.

Or to compute the times of new moon which belong to the commencement of successive years, we must in passing from an ordinary year, deduce the new moon of the following year by subtracting the interval that twelve lunations fall short of the corresponding Gregorian year of 365 or 366 days; and for an embolismic year we must add the excess of thirteen lunations over the Gregorian year; that is, to get the new moon of Tisri for the year immediately following any given year Y , we must,

for an ordinary year, subtract $\left\{ \begin{smallmatrix} 10 \\ 11 \end{smallmatrix} \right\}$ days 15h. 11m. 20s.,

„ embolismic „ add $\left\{ \begin{smallmatrix} 18 \\ 17 \end{smallmatrix} \right\}$ days 21h. 32m. $43\frac{1}{2}$ s.,

the second mentioned number of days being used whenever the year Y is divisible by 4 without a remainder, or, more correctly, when the following or new Gregorian year is bissextile.

Thus, by knowing which of the years are embolismic, from their ordinal position in the cycle, according to the rule before stated, the times of the commencement of successive years may be carried on indefinitely without much trouble.

¹ This being 6 min. 37 sec. in excess of the mean solar year, the dates of commencement of future Jewish years so calculated will advance forward from the equinox a day in error in every 218 years. The lunations, *it will be observed*, are estimated with greater precision.

We annex a few by way of example, and have distinguished by a * the years which are embolismic and bissextile. The hours are counted from the previous midnight, according to the civil reckoning.

Year	year of cycle	1,	date 1845	Oct.	d.	h.	m.	s.
5606,		1,		Oct.	1	15	42	43½
5607	"	"	2,	"	1846	Sept.	21	0 31 23½
5608	"	"	*3,	"	1847	"	10	9 20 3½
5609	"	"	4,	"	*1848	"	28	6 52 46½
5610	"	"	5,	"	1849	"	17	5 41 26½
5611	"	"	*6,	"	1850	"	7	0 30 6½
5612	"	"	7,	"	1851	"	25	22 2 50
5613	"	"	*8,	"	*1852	"	14	6 51 30
5614	"	"	9,	"	1853	Oct.	3	4 24 13½
&c.			&c.					&c.

But it must be observed, for the reasons before assigned, to avoid certain festivals falling on incompatible days of the week, that the year must not begin on a Sunday, Wednesday, or Friday, so that if the computed conjunction falls on one of these days the new year is to be fixed on the day after. The following conditions also require to be attended to:—

If the computed new moon be after 12h. the following day is to be taken, and if that happen to be Sunday, Wednesday, or Friday, it must be postponed one day more.

If in an ordinary year the new moon is on Tuesday, as late as 9h. 11m. 20s., it is not to be observed thereon; and, as it may not be held on Wednesday, it is to be postponed to Thursday.

If in a year immediately following an embolismic year the new moon is on Monday, as late as 15h. 30m. 52s., the new year is to be fixed on Tuesday.

The number of days contained in any given Jewish year, and the day of the week on which it commences, may be readily calculated by means of the following tables, the use of which will be best explained by an example.

Example.—Required the character of the Jewish year 5640.

Having found the next less year in the table of completed cycles, the calculation is as follows:—

Proposed year	5640	
296 cycles	5624	Number 2525,480
Year of cycle . .	16	($R = 11$) 2278,271
		Sum 4803,751

Referring to the third table in the column under $R = 11$, the number next less to this sum is 4743,996, and it stands opposite to "354 Thur.," showing that the year is ordinary, contains 354 days, and begins on a Thursday.

By the second table the approximate date of commencement is 17 Sept., and the corresponding year of our Lord is $5640 - 3761 = 1879$. Now, referring to the table, page 146, the Dominical letter for this year is E, and 17 Sept. is Wednesday. Therefore, as the Jewish year has been found to begin on a Thursday, the true date of commencement is 18 Sept. 1879.

The Gregorian epact being the age of the moon of Tebet at the beginning of the year, it represents the day of Tebet which corresponds to Jan. 1; and the approximate date of Tisri 1 may be otherwise deduced by subtracting the epact

from $\left\{ \begin{array}{l} \text{Sept. 24} \\ \text{Oct. 24} \end{array} \right\}$ after an $\left\{ \begin{array}{l} \text{ordinary} \\ \text{embolismic} \end{array} \right\}$ year.

The result so obtained would in general be more accurate than the Jewish calculation, and it may differ a day from the latter, as fractions of a day are omitted in these computations. The difference may, however, be adjusted as before by means of the day of the week.

Completed Cycles.	Year.	Number.
295	5605	1200,895
296	5624	2525,480
297	5643	402,705
298	5662	1727,290
299	5681	3051,875
300	5700	929,100
301	5719	2253,685
302	5738	130,910
303	5757	1455,495

305	5795	657,305
306	5814	1981,890
307	5833	3306,475
308	5852	1183,700
309	5871	2508,285
310	5890	385,510
311	5909	1710,095
312	5928	3034,680
313	5947	911,905
314	5966	2236,490
315	5985	113,715
316	6004	1438,300
317	6023	2762,885
318	6042	640,110
319	6061	1964,695
320	6080	3289,280

Year of Cycle.	R.	Number.	Approximate Commencement (Tisri).
1	1	722,076	2 Oct. *
2	8	2872,800	21 Sept.
3	15	1576,164	10 "
4	3	1033,315	29 "
5	10	3184,039	18 Sept.
6	17	1887,403	8 "
7	5	1344,554	27 "
8	12	47,918	15 "
9	0	2952,429	4 Oct.
10	7	1655,793	23 Sept.
11	14	359,157	12 "
12	2	3263,668	1 Oct.
13	9	1967,032	20 Sept.
14	16	670,396	9 "
15	4	127,547	28 Sept.
16	11	2278,271	17 "
17	18	981,635	6 "
18	6	438,786	25 "
19	13	2589,510	14 "

* The corresponding year of our Lord is obtained by subtracting 3761 from the Jewish year, and *vice versa*; and the approximate date of commencement may be adjusted to the accurate date by means of the true day of the week taken from the next table.

The annexed table exhibits the principal fasts and festivals, and it is followed by a table of the dates, &c. of Jewish years up to the year 2072, and the completion of the 307th cycle. When the date of commencement and number of days contained in a year are known, the number of days contained in the several months are shown in the table, page 171, and the construction of a detailed calendar for that year is obvious.

Principal Days of the JEWISH CALENDAR.

Tebet	1	1st of Tebet.
"	10 Fast	Fast; Siege of Jerusalem.
Sebat	1	1st of Sebat.
Adar	1	1st of Adar.
"	13, or 11 if Tisri 1 } be Thursday }	Fast of Esther } In Embol Years
"	14 } Purim	{ Purim substitute <i>Veadar</i> ,
"	15 } Purim	{ Second Day and same days.
Veadar	1	1st of Veadar (if Embolismic Year).
Nisan	1	1st of Nisan.
"	15 } Passover	{ Passover.
"	16 } Passover	{ Second Day.
Yiar	1	1st of Yiar.
Sivan	1	1st of Sivan.
"	6 } Sebuot	{ Pentecost.
"	7 } Sebuot	{ Second Day.
Tamuz	1	1st of Tamuz.
"	17, or 18 if Tisri 1 } be Monday }	Fast; Taking of Jerusalem.
Ab	1	1st of Ab.
"	9, or 10 if Tisri 1 } be Monday }	Fast; Destruction of the Temple.
Elul	1	1st of Elul.
TISRI	1 New Year	1st of Tisri (Yr begins).
"	2	Second Day.
"	3, or 4 if Tisri 1 } be Thursday }	Fast of Guedaliah.
"	10 Kipur	Fast of Expiation.
"	15 } Tabernacle.	{ Feast of Tabernacles.
"	16 } Tabernacle.	{ Second Day.
"	21 Hosana Raba	Last day of the Festival.
"	22 } 8th day	{ Feast of the 8th day.
"	23 } 8th day	{ Rejoicing of the Law.
Hesvan	1	1st of Hesvan.
Kislev	1	1st of Kislev.
	25 Hanuca	Dedication of the Temple.
Tebet	1	1st of Tebet.

MAHOMETAN CALENDAR.

The Mahometan era, or era of the Hegira, employed in Turkey, Persia, Arabia, &c., is dated from the flight of Mahomet from Mecca to Medina, which was in the night of Thursday the 15th of July, A.D. 622, and it commenced on the day following. The years of the Hegira are purely lunar, and always consist of twelve lunar months commencing with the approximate new moon, without any intercalation to keep them to the same season with respect to the Sun, so that they retrograde through all the seasons in about $32\frac{1}{2}$ years. They are also partitioned into cycles of 30 years, 19 of which are common years of 354 days each, and the other 11 are intercalary years having an additional day appended to the last month. The mean length of the year is therefore $354\frac{11}{30}$ days or 354 days 8 hours 48 min., which divided by 12 gives $29\frac{191}{960}$ days or 29 days 12 hours 44 min. as the time of a mean lunation, and this differs from the astronomical mean lunation by only 3 seconds. This small error will not amount to a day in less than 2300 years.

To find if a year is intercalary or common, divide it by 30; the quotient will be the number of completed cycles and the remainder will be the year of the current cycle; if this last be one of the numbers 2, 5, 7, 10, 13, 16, 18, 21, 24, 26, 29, the year is intercalary and consists of 355 days; if it be any other number, the year is ordinary.

Or if Y denote the number of the year, and

$$R = \left(\frac{11Y + 14}{30} \right)_r;$$

the year is intercalary when $R < 11$.

Also the number of intercalary years from the year 1 up to the year Y inclusive = $\left(\frac{11Y + 14}{30} \right)_w$; and the same, exclusive of the year Y , = $\left(\frac{11Y + 3}{30} \right)_w$.

To find the day of the week on which any year of the Hegira begins, we observe that the year 1 began on a Friday, and that after every common year of 354 days, or 50 weeks and 4 days, the day of the week must necessarily become postponed 4 days, besides the additional day of each intercalary year.

Hence if $w = 1$ indicate Sun. | 2 Mon. | 3 Tues. | 4 Wed. | 5 Thur. | 6 Frid. | 7 Sat. |

the day of the week on which the year X commences will be

$$w = 2 + 4\left(\frac{X}{7}\right)_r + \left(\frac{11X + 3}{30}\right)_w \text{ (rejecting sevens);}$$

which admits of being reduced to the more convenient formula

$$w = 7 - \left(\frac{X}{7}\right)_r + 3\left(\frac{11X + 3}{30}\right)_r \text{ (rejecting sevens),}$$

the values of which obviously circulate in a period of 7 times 30 or 210 years.

Let C denote the number of completed cycles, and y the year of the cycle; then $X = 30C + y$, and

$$w = 5\left(\frac{C}{7}\right)_r + 6\left(\frac{y}{7}\right)_r + 3\left(\frac{11y + 3}{30}\right)_r \text{ (rejecting sevens).}$$

From this formula the following table has been constructed:—

Year of the Current Cycle (y).				Number of the Period of Seven Cycles = $\left(\frac{C}{7}\right)_r$						
				0	1	2	3	4	5	6
0	8			Mon.	Sat.	Thur.	Tues.	Sun.	Frid.	Wed.
1	9	17	25	Frid.	Wed.	Mon.	Sat.	Thur.	Tues.	Sun.
*2	*10	*18	*26	Tues.	Sun.	Frid.	Wed.	Mon.	Sat.	Thur.
3	11	19	27	Sun.	Frid.	Wed.	Mon.	Sat.	Thur.	Tues.
4	12	20	28	Thur.	Tues.	Sun.	Frid.	Wed.	Mon.	Sat.
*5	*13	*21	*29	Mon.	Sat.	Thur.	Tues.	Sun.	Frid.	Wed.
6	14	22	30	Sat.	Thur.	Tues.	Sun.	Frid.	Wed.	Mon.
*7	*15	*23		Wed.	Mon.	Sat.	Thur.	Tues.	Sun.	Frid.
	*16	*24		Sun.	Frid.	Wed.	Mon.	Sat.	Thur.	Tues.

To find from this table the day of the week on which any year of the Hegira commences, the rule to be observed will be as follows :—

Rule.—Divide the year of the Hegira by 30 ; the quotient is the number of cycles, and the remainder is the year of the current cycle. Next divide the number of cycles by 7, and the second remainder will be the Number of the Period, which being found at the top of the table, and the year of the cycle on the left hand, the required day of the week is immediately shown.

The intercalary years of the cycle are distinguished by an asterisk.

For the computation of the Christian date, the ratio of a mean year of the Hegira to a solar year is

$$\frac{\text{Year of Hegira}}{\text{Mean solar year}} = \frac{354\frac{11}{30}}{365\cdot24222} = 0\cdot970224.$$

The year 1 began 16 July, 622, Old Style, or 19 July, 622, according to the New or Gregorian Style. Now the day of the year answering to the 19th of July is 200 which, in parts of the solar year, is 0·5476, and the number of years elapsed = $Y - 1$. Therefore, as the intercalary days are distributed with considerable regularity in both calendars, the date of commencement of the year Y expressed in Gregorian years is

$$\begin{aligned} &0\cdot970224 (Y - 1) + 622\cdot5476, \\ &\text{or } 0\cdot970224 Y + 621\cdot5774. \end{aligned}$$

This formula gives the following rule for calculating the date of the commencement of any year of the Hegira, according to the Gregorian or New Style.

Rule.—Multiply 970224 by the year of the Hegira, cut ~~the~~ decimals from the product, and add 621·5774. The

sum will be the year of the Christian era, and the day of the year will be found by multiplying the decimal figures by 365.

The result may sometimes differ a day from the truth as the intercalary days do not occur simultaneously; but as the day of the week can always be accurately obtained from the foregoing table, the error, if any, can be readily adjusted.

Example.—Required the date on which the year 1362 of the Hegira begins.

$$\begin{array}{r}
 970224 \\
 1362 \\
 \hline
 1940448 \\
 5821344 \\
 2910672 \\
 970224 \\
 \hline
 1321\cdot445088 \\
 621\cdot5774 \\
 \hline
 1943\cdot0225 \\
 365 \\
 \hline
 1125 \\
 1350 \\
 675 \\
 \hline
 8\cdot2125
 \end{array}$$

Thus the date is the 8th day, or 8 January, of the year 1943.

To find, as a test, the accurate day of the week, the proposed year of the Hegira divided by 30 gives 45 cycles and remainder 12, the year of the current cycle.

Also 45 divided by 7 leaves a remainder 3 for the number of the period.

Therefore, referring to 3 at the top of the table and 12 on the left, the required day is Friday.

The tables, pages 146-7, show that 8 Jan. 1943 is a Friday; therefore the date is exact.

For any other date of the Mahometan year it is only requisite to know the names of the consecutive months, and the length of each; these are,

Muharram	30	Shaaban	29
Saphar	29	Ramadân	30
Rabia I.	30	Shawall	29
Rabia II.	29	Dulkaada	30
Jomada I.	30	Dulheggia	29
Jomada II.	29	and, in intercalary	}
Rajab	30	years, 30 days.	

The ninth month, Ramadân, is the month of Abstinence observed by the Turks.

The Turkish calendar may evidently be carried on indefinitely by successive addition, observing only to allow for the additional day that occurs in the bissextile and intercalary years; but for any remote date the computation according to the preceding rules will be most efficient, and such computation may be usefully employed as a check on the accuracy of any considerable extension of the calendar by induction alone.

The following table shows the dates of commencement of Mahometan years for 1845 up to 2047, or from the 43rd to the 49th cycle inclusive, which form the whole of the seventh period of seven cycles. Throughout the next period of seven cycles, and all other like periods, the days of the week will recur in exactly the same order.

All the tables hitherto published, of this kind, which extend beyond the year 1900 of the Christian era, are erroneous, not excepting the celebrated French work, *L'Art de vérifier les Dates*, so justly regarded as the greatest authority in chronological matters. The errors have probably arisen from a continued excess of 10 in the discrimination of the intercalary years, and they have been faithfully transcribed by other authors.

ENGINEERING, SURVEYING, ETC.

Humber's New Work on Water-Supply.

A COMPREHENSIVE TREATISE on the WATER-SUPPLY of CITIES and TOWNS. By WILLIAM HUMBER, A-M. Inst. C.E., and M. Inst. M.E. Illustrated with 50 Double Plates, 1 Single Plate, Coloured Frontispiece, and upwards of 250 Woodcuts, and containing 400 pages of Text, Imp. 4to, 6l. 6s. elegantly and substantially half-bound in morocco.

List of Contents:—

I. Historical Sketch of some of the means that have been adopted for the Supply of Water to Cities and Towns.—II. Water and the Foreign Matter usually associated with it.—III. Rainfall and Evaporation.—IV. Springs and the water-bearing formations of various districts.—V. Measurement and Estimation of the Flow of Water.—VI. On the Selection of the Source of Supply.—VII. Wells.—VIII. Reservoirs.—IX. The Purification of Water.—X. Pumps.—XI. Pumping

Machinery.—XII. Conduits.—XIII. Distribution of Water.—XIV. Meters, Service Pipes, and House Fittings.—XV. The Law and Economy of Water Works.—XVI. Constant and Intermittent Supply.—XVII. Description of Plates.—Appendices, giving Tables of Rates of Supply, Velocities, &c. &c., together with Specifications of several Works illustrated, among which will be found:—Aberdeen, Bideford, Canterbury, Dundee, Halifax, Lambeth, Rotherham, Dublin, and others.

"The most systematic and valuable work upon water supply hitherto produced in English, or in any other language . . . Mr. Humber's work is characterised almost throughout by an exhaustiveness much more distinctive of French and German than of English technical treatises."—*Engineer*.

Humber's Great Work on Bridge Construction.

A COMPLETE and PRACTICAL TREATISE on CAST and WROUGHT-IRON BRIDGE CONSTRUCTION, including Iron Foundations. In Three Parts—Theoretical, Practical, and Descriptive. By WILLIAM HUMBER, A-M. Inst. C.E., and M. Inst. M.E. Third Edition, with 115 Double Plates. In 2 vols. imp. 4to, 6l. 16s. 6d. half-bound in morocco.

"A book—and particularly a large and costly treatise like Mr. Humber's—which has reached its third edition may certainly be said to have established its own reputation."—*Engineering*.

Humber's Modern Engineering.

A RECORD of the PROGRESS of MODERN ENGINEERING. First Series. Comprising Civil, Mechanical, Marine, Hydraulic, Railway, Bridge, and other Engineering Works, &c. By WILLIAM HUMBER, A-M. Inst. C.E., &c. Imp. 4to, with 36 Double Plates, drawn to a large scale, and Portrait of John Hawkshaw C.E., F.R.S., &c., and descriptive Letter-press, Specifications, &c. 3l. 3s. half morocco.

List of the Plates and Diagrams.

Victoria Station and Roof, L. B. & S. plates); Bridge over the Thames, West London Extension Railway (5 plates); Armour Plates; Suspension Bridge, Thames (4 plates); The Allen Engine; Suspension Bridge, Avon (3 plates); Underground Railway (3 plates).

"Handsomely lithographed and printed. It will find favour with many who desire to preserve in a permanent form copies of the plans and specifications prepared for the guidance of the contractors for many important engineering works."—*Engineer*.

HUMBER'S RECORD OF MODERN ENGINEERING. Second Series. Imp. 4to, with 36 Double Plates, Portrait of Robert Stephenson, C.E., &c., and descriptive Letterpress, Specifications, &c. 3l. 3s. half morocco.

List of the Plates and Diagrams.

Birkenhead Docks, Low Water Basin (15 plates); Charing Cross Station Roof, C. C. Railway (3 plates); Digswell Viaduct, G. N. Railway; Robbery Wood Viaduct, G. N. Railway; Iron Permanent Way; Clydach Viaduct, Merthyr, Tredegar, and Abergavenny Railway; Ebbw Viaduct, Merthyr, Tredegar, and Abergavenny Railway (4 plates); Albert Harbour, Greenock (4 plates).

HUMBER'S RECORD OF MODERN ENGINEERING. Third Series. Imp. 4to, with 40 Double Plates, Portrait of J. R. M'Clean, Esq., late Pres. Inst. C.E., and descriptive Letterpress, Specifications, &c. 3l. 3s. half morocco.

List of the Plates and Diagrams.

MAIN DRAINAGE, METROPOLIS.—*North Side*.—Map showing Interception of Sewers; Middle Level Sewer (2 plates); Outfall Sewer, Bridge over River Lea (3 plates); Outfall Sewer, Bridge over Marsh Lane, North Woolwich Railway, and Bow and Barking Railway Junction; Outfall Sewer, Bridge over Bow and Barking Railway (3 plates); Outfall Sewer, Bridge over East London Waterworks' Feeder (2 plates); Outfall Sewer, Reservoir (2 plates); Outfall Sewer, Tumbling Bay and Outlet; Outfall Sewer, Penstocks.

South Side.—Outfall Sewer, Bermondsey Branch (2 plates); Outfall Sewer, Reservoir and Outlet (4 plates); Outfall Sewer, Filth Hoist; Sections of Sewers (North and South Sides).

THAMES EMBANKMENT.—Section of River Wall; Steamboat Pier, Westminster (2 plates); Landing Stairs between Charing Cross and Waterloo Bridges; York Gate (2 plates); Overflow and Outlet at Savoy Street Sewer (3 plates); Steamboat Pier, Waterloo Bridge (3 plates); Junction of Sewers, Plans and Sections; Gullies, Plans and Sections; Rolling Stock; Granite and Iron Forts.

HUMBER'S RECORD OF MODERN ENGINEERING. Fourth Series. Imp. 4to, with 36 Double Plates, Portrait of John Fowler, Esq., late Pres. Inst. C.E., and descriptive Letterpress, Specifications, &c. 3l. 3s. half morocco.

List of the Plates and Diagrams.

Abbey Mills Pumping Station, Main Drainage, Metropolis (4 plates); Barrow Docks (5 plates); Manquis Viaduct, Santiago and Valparaiso Railway (2 plates); Adam's Locomotive St. Helen's Canal Railway (2 plates); Cannon Street Station Roof, Charing Cross Railway (3 plates); ~~Road Bridge~~ Bridge over the River Moka (2 plates); Telegraphic Apparatus for Mesopotamia; Viaduct over the River Wye, Midland Railway (3 plates); St. German's Viaduct, Cornwall Railway (2 plates); Wrought-Iron Cylinder for Diving Bell; Millwall Docks (6 plates); Milroy's Patent Excavator, Metropolitan District Railway (6 plates); Harbours, Ports, and Breakwaters (3 plates).

Strains, Formulæ & Diagrams for Calculation of.

A HANDY BOOK for the CALCULATION of STRAINS in GIRDERS and SIMILAR STRUCTURES, and their STRENGTH; consisting of Formulæ and Corresponding Diagrams, with numerous Details for Practical Application, &c. By WILLIAM HUMBER, A-M. Inst. C.E., &c. Third Edition. With nearly 100 Woodcuts and 3 Plates, Crown 8vo, 7s. 6d. cloth.

"The arrangement of the matter in this little volume is as convenient as it well could be. . . . The system of employing diagrams as a substitute for complex computations is one justly coming into great favour, and in that respect Mr. Humber's volume is fully up to the times."—*Engineering*.

"The formulæ are neatly expressed, and the diagrams good."—*Athenæum*.

Strains.

THE STRAINS ON STRUCTURES OF IRONWORK; with Practical Remarks on Iron Construction. By F. W. SHEILDS, M. Inst. C.E. Second Edition, with 5 Plates. Royal 8vo, 5s. cloth.

"The student cannot find a better little book on this subject than that written by Mr. Shields."—*Engineer*.

Barlow on the Strength of Materials, enlarged.

A TREATISE ON THE STRENGTH OF MATERIALS, with Rules for application in Architecture, the Construction of Suspension Bridges, Railways, &c.; and an Appendix on the Power of Locomotive Engines, and the effect of Inclined Planes and Gradients. By PETER BARLOW, F.R.S. A New Edition, revised by his Sons, P. W. BARLOW, F.R.S., and W. H. BARLOW, F.R.S. The whole arranged and edited by W. HUMBER, A-M. Inst. C.E. 8vo, 400 pp., with 19 large Plates, 18s. cloth.

"The best book on the subject which has yet appeared. . . . We know of no work that so completely fulfils its mission."—*English Mechanic*.

"The standard treatise upon this particular subject."—*Engineer*.

Strength of Cast Iron, &c.

A PRACTICAL ESSAY on the STRENGTH of CAST IRON and OTHER METALS. By THOMAS TREDGOLD, C.E. Fifth Edition. To which are added, Experimental Researches on the Strength and other Properties of Cast Iron, by E. HODGKINSON, F.R.S. With 9 Engravings and numerous Woodcuts. 8vo, 12s. cloth. *^{*} HODGKINSON'S RESEARCHES, separate, price 6s.

Hydraulics.

HYDRAULIC TABLES, CO-EFFICIENTS, and FORMULÆ for finding the Discharge of Water from Orifices, Notches, Weirs, Pipes, and Rivers. With New Formulæ, Tables, and General Information on Rain-fall, Catchment-Basins, Drainage, Sewerage, Water Supply for Towns and Mill Power. By JOHN NEVILLE, Civil Engineer, M.R.I.A. Third Edition, carefully revised, with considerable Additions. Numerous Illustrations. Cr. 8vo, 14s. cloth.

"Undoubtedly an exceedingly useful and elaborate compilation."—*Iron*.

"Alike valuable to students and engineers in practice."—*Mining Journal*.

River Engineering.

RIVER BARS: Notes on the Causes of their Formation, and on their Treatment by Induced Tidal Scour, with a Description of the Successful Reduction by this Method of the Bar at Dublin. By I. J. MANN, Assistant Engineer to the Dublin Port and Docks Board. With Illustrations. Demy 8vo. [In the press.]

Levelling.

A TREATISE on the PRINCIPLES and PRACTICE of LEVELLING; showing its Application to Purposes of Railway and Civil Engineering, in the Construction of Roads; with Mr. TELFORD's Rules for the same. By FREDERICK W. SIMMS, F.G.S., M. Inst. C.E. Sixth Edition, very carefully revised, with the addition of Mr. LAW's Practical Examples for Setting out Railway Curves, and Mr. TRAUTWINE's Field Practice of Laying out Circular Curves. With 7 Plates and numerous Woodcuts. 8vo, 8s. 6d. cloth.

* * TRAUTWINE on Curves, separate, 5s.

"The text-book on levelling in most of our engineering schools and colleges."—*Engineer.*

Practical Tunnelling.

PRACTICAL TUNNELLING: Explaining in detail the Setting out of the Works, Shaft-sinking and Heading-Driving, Ranging the Lines and Levelling under Ground, Sub-Excavating, Timbering, and the Construction of the Brickwork of Tunnels with the amount of labour required for, and the Cost of, the various portions of the work. By F. W. SIMMS, M. Inst. C.E. Third Edition, Revised and Extended. By D. KINNEAR CLARK, M.I.C.E. Imp. 8vo, with 21 Folding Plates and numerous Wood Engravings, 30s. cloth.

"It has been regarded from the first as a text-book of the subject. . . . Mr. Clark has added immensely to the value of the book."—*Engineer.*

Steam.

STEAM AND THE STEAM ENGINE, Stationary and Portable. Being an Extension of Sewell's Treatise on Steam. By D. KINNEAR CLARK, M.I.C.E. Second Edition. 12mo, 4s. cloth.

Civil and Hydraulic Engineering.

CIVIL ENGINEERING (THE RUDIMENTS OF). By HENRY LAW, M. Inst. C.E. Including a Treatise on Hydraulic Engineering, by GEORGE R. BURNELL, M.I.C.E. Sixth Edition, Revised, with large additions on Recent Practice in Civil Engineering, by D. KINNEAR CLARK, M. Inst. C.E. [*In the press.*]

Gas-Lighting.

COMMON SENSE FOR GAS-USERS: a Catechism of Gas-Lighting for Householders, Gasfitters, Millowners, Architects, Engineers, &c. By R. WILSON, C.E. 2nd Edition. Cr. 8vo, 2s. 6d.

Bridge Construction in Masonry, Timber, & Iron.

EXAMPLES OF BRIDGE AND VIADUCT CONSTRUCTION OF MASONRY, TIMBER, AND IRON; consisting of 46 Plates from the Contract Drawings or Admeasurement of select Works. By W. DAVIS HASKOLL, C.E. Second Edition, with the addition of 554 Estimates, and the Practice of Setting out Works, with 6 pages of Diagrams. Imp. 4to, 2l. 12s. 6d. half-morocco.

"A work of the present nature by a man of Mr. Haskoll's experience, must prove invaluable. The tables of estimates considerably enhance its value."—*Engineering.*

Earthwork.

EARTHWORK TABLES, showing the Contents in Cubic Yards of Embankments, Cuttings, &c., of Heights or Depths up to an average of 80 feet. By JOSEPH BROADBENT, C.E., and FRANCIS AMPIN, C.E. Cr. 8vo, oblong, 5s. cloth.

Tramways and their Working.

TRAMWAYS: their CONSTRUCTION and WORKING. Containing a Comprehensive History of the System; an exhaustive Analysis of the Various Modes of Traction, including Horse Power, Steam, Heated Water, and Compressed Air; a Description of the varieties of Rolling Stock; and ample Details of Cost and Working Expenses, with Special Reference to the Tramways of the United Kingdom. By D. KINNEAR CLARK, M. I. C. E., Author of 'Railway Machinery,' &c., in one vol. 8vo, with numerous Illustrations and thirteen folding Plates, 18s. cloth.

"All interested in tramways must refer to it, as all railway engineers have turned to the author's work 'Railway Machinery.'"—*The Engineer*.

"Mr. Clark's book is indispensable for the students of the subject."—*The Builder*.

Pioneer Engineering.

PIONEER ENGINEERING. A Treatise on the Engineering Operations connected with the Settlement of Waste Lands in New Countries. By EDWARD DOBSON, A.I.C.E. With Plates and Wood Engravings. Revised Edition. 12mo, 5s. cloth.

"A workmanlike production, and one without possession of which no man should start to encounter the duties of a pioneer engineer."—*Athenæum*.

"There is much in the book to render it very useful to an engineer proceeding to the colonies."—*Engineer*.

Steam Engine.

TEXT-BOOK ON THE STEAM ENGINE. By T. M. GOODEVE, M.A., Barrister-at-Law, Author of "The Principles of Mechanics," "The Elements of Mechanism," &c. Third Edition. With numerous Illustrations. Crown 8vo, 6s. cloth.

"Professor Goodeve has given us a treatise on the steam engine, which will bear comparison with anything written by Huxley or Maxwell, and we can award it no higher praise."—*Engineer*.

"Mr. Goodeve's text-book is a work of which every young engineer should possess himself."—*Mining Journal*.

Steam.

THE SAFE USE OF STEAM: containing Rules for Unprofessional Steam Users. By an ENGINEER. 4th Edition. Sewed, 6d.

"If steam-users would but learn this little book by heart, boiler explosions would become sensations by their rarity."—*English Mechanic*.

Works of Construction.

MATERIALS AND CONSTRUCTION: a Theoretical and Practical Treatise on the Strains, Designing, and Erection of Works of Construction. By FRANCIS CAMPIN, C.E., Author of "A Practical Treatise on Mechanical Engineering;" "The Principles and Construction of Machinery," &c. With Numerous Illustrations. 12mo, 3s. 6d. cloth boards. [Just published.]

Iron Bridges, Girders, Roofs, &c.

A TREATISE ON THE APPLICATION OF IRON TO THE CONSTRUCTION OF BRIDGES, GIRDERS, ROOFS, AND OTHER WORKS. By FRANCIS CAMPIN, C.E. Second Edition, Revised and Corrected. 12mo, 3s. cloth.

Construction of Iron Beams, Pillars, &c.

IRON AND HEAT; exhibiting the Principles concerned in the construction of Iron Beams, Pillars, and Bridge Girders, and the Action of Heat in the Smelting Furnace. By J. ARMOUR, C.E.

Oblique Arches.

A PRACTICAL TREATISE ON THE CONSTRUCTION OF OBLIQUE ARCHES. By JOHN HART. 3rd Ed. Imp. 8vo, 8s. cloth.

Oblique Bridges.

A PRACTICAL and THEORETICAL ESSAY on OBLIQUE BRIDGES, with 13 large Plates. By the late GEO. WATSON BUCK, M.I.C.E. Third Edition, revised by his Son, J. H. WATSON BUCK, M.I.C.E.; and with the addition of Description to Diagrams for Facilitating the Construction of Oblique Bridges, by W. H. BARLOW, M.I.C.E. Royal 8vo, 12s. cloth. [Just published.]

"The standard text book for all engineers regarding skew arches is Mr. Buck's treatise and it would be impossible to consult a better."—*Engineer*.

Gas and Gasworks.

THE CONSTRUCTION OF GASWORKS AND THE MANUFACTURE AND DISTRIBUTION OF COAL-GAS. Originally written by SAMUEL HUGHES, C.E. Sixth Edition. Re-written and much Enlarged, by WILLIAM RICHARDS, C.E. With 72 Woodcuts. 12mo, 5s. cloth boards. [Just published.]

Waterworks for Cities and Towns.

WATERWORKS for the SUPPLY of CITIES and TOWNS, with a Description of the Principal Geological Formations of England as influencing Supplies of Water. By S. HUGHES. 4s. 6d. cloth.

Locomotive-Engine Driving.

LOCOMOTIVE-ENGINE DRIVING; a Practical Manual for Engineers in charge of Locomotive Engines. By MICHAEL REYNOLDS, M.S.E., formerly Locomotive Inspector L. B. and S. C. R. Fourth Edition, greatly enlarged. Comprising A KEY TO THE LOCOMOTIVE ENGINE. With Illustrations and Portrait of Author. Crown 8vo, 4s. 6d. cloth.

"Mr. Reynolds deserves the title of the engine driver's friend."—*Railway News*.

"Mr. Reynolds has supplied a want, and has supplied it well. We can confidently recommend the book not only to the practical driver, but to every one who takes an interest in the performance of locomotive engines."—*Engineer*.

The Engineer, Fireman, and Engine-Boy.

THE MODEL LOCOMOTIVE ENGINEER, FIREMAN, AND ENGINE-BOY: comprising a Historical Notice of the Pioneer Locomotive Engines and their Inventors, with a project for the establishment of Certificates of Qualification in the Running Service of Railways. By MICHAEL REYNOLDS, Author of "Locomotive-Engine Driving." Crown 8vo, 4s. 6d. cloth.

"From the technical knowledge of the author it will appeal to the railway man of to-day more forcibly than anything written by Dr. Smiles."—*English Mechanic*.

Stationary Engine Driving.

STATIONARY ENGINE DRIVING. A Practical Manual for Engineers in Charge of Stationary Engines. By MICHAEL REYNOLDS ("The Engine-Driver's Friend"), Author of "Locomotive Engine Driving," &c. With Plates and Woodcuts, and Steel Portrait of James Watt. Crown 8vo, 4s. 6d. cloth. [Just published.]

Engine-Driving Life.

ENGINE-DRIVING LIFE; or Stirring Adventures and Incidents in the Lives of Locomotive Engine-Drivers. By MICHAEL REYNOLDS. Crown 8vo, 2s. cloth. [Just published.]

Fire Engineering.

FIRES, FIRE-ENGINES, AND FIRE BRIGADES. With a History of Fire-Engines, their Construction, Use, and Management; Remarks on Fire-Proof Buildings, and the Preservation of Life from Fire; Statistics of the Fire Appliances in English Towns; Foreign Fire Systems; Hints on Fire Brigades, &c., &c. By CHARLES F. T. YOUNG, C.E. With numerous Illustrations, handsomely printed, 544 pp., demy 8vo, 1*l.* 4*s.* cloth.

"We can most heartily commend this book."—*Engineering*.

"Mr. Young's book on 'Fire Engines and Fire Brigades' contains a mass of information, which has been collected from a variety of sources. The subject is so intensely interesting and useful that it demands consideration."—*Building News*.

Trigonometrical Surveying.

AN OUTLINE OF THE METHOD OF CONDUCTING A TRIGONOMETRICAL SURVEY, for the Formation of Geographical and Topographical Maps and Plans, Military Reconnaissance, Levelling, &c., with the most useful Problems in Geodesy and Practical Astronomy. By LIEUT.-GEN. FROME, R.E., late Inspector-General of Fortifications. Fourth Edition, Enlarged, and partly Re-written. By CAPTAIN CHARLES WARREN, R.E. With 19 Plates and 115 Woodcuts, royal 8vo, 16*s.* cloth.

Tables of Curves.

TABLES OF TANGENTIAL ANGLES and MULTIPLES for setting out Curves from 5 to 200 Radius. By ALEXANDER BRAZELEY, M. Inst. C.E. Second Edition. Printed on 48 Cards, and sold in a cloth box, waistcoat-pocket size, 3*s.* 6*d.*

"Each table is printed on a small card, which, being placed on the theodolite, leaves the hands free to manipulate the instrument—no small advantage as regards the rapidity of work."—*Engineer*.

"Very handy; a man may know that all his day's work must fall on two of these cards, which he puts into his own card-case, and leaves the rest behind."—*Athenæum*.

Engineering Fieldwork.

THE PRACTICE OF ENGINEERING FIELDWORK, applied to Land and Hydraulic, Hydrographic, and Submarine Surveying and Levelling. Second Edition, revised, with considerable additions, and a Supplement on WATERWORKS, SEWERS, SEWAGE, and IRRIGATION. By W. DAVIS HASKOLL, C.E. Numerous folding Plates. In One Volume, demy 8vo, 1*l.* 5*s.*, cloth boards.

Large Tunnel Shafts.

THE CONSTRUCTION OF LARGE TUNNEL SHAFTS. A Practical and Theoretical Essay. By J. H. WATSON BUCK, M. Inst. C.E., Resident Engineer, London and North-Western Railway. Illustrated with Folding Plates. Royal 8vo, 12*s.* cloth. [Just published.]

"Many of the methods given are of extreme practical value to the mason, and the observations on the form of arch, the rules for ordering the stone, and the construction of the templates, will be found of considerable use. We commend the book to the engineering profession, and to all who have to build similar shafts."—*Building News*.

"Will be regarded by civil engineers as of the utmost value, and calculated to save much time and obviate many mistakes."—*Colliery Guardian*.

Survey Practice.

AID TO SURVEY PRACTICE: for Reference in Surveying, Levelling, Setting-out and in Route Surveys of Travellers by Land and Sea. With Tables, Illustrations, and Records. By **LOWIS D'A. JACKSON, A.M.I.C.E.** Author of "Hydraulic Manual and Statistics," "Canal and Culvert Tables," &c. Large crown, 8vo, 12s. 6d., cloth. [Just published.]

"Mr. Jackson has produced a valuable *vade-mecum* for the surveyor. We can recommend this book as containing an admirable supplement to the teaching of the accomplished surveyor."—*Athenaeum*.

"A general text book was wanted, and we are able to speak with confidence of Mr. Jackson's treatise. . . . We cannot recommend to the student who knows something of the mathematical principles of the subject a better course than to fortify his practice in the field under a competent surveyor with a study of Mr. Jackson's useful manual. The field records illustrate every kind of survey, and will be found an essential aid to the student."—*Building News*.

"The author brings to his work a fortunate union of theory and practical experience which, aided by a clear and lucid style of writing, renders the book both a very useful one and very agreeable to read."—*Builder*.

Sanitary Work.

SANITARY WORK IN THE SMALLER TOWNS AND IN VILLAGES. Comprising:—1. Some of the more Common Forms of Nuisance and their Remedies; 2. Drainage; 3. Water Supply. By **CHAS. SLAGG, Assoc. Inst. C.E.** Crown 8vo, 3s. cloth.

"A very useful book, and may be safely recommended. The author has had practical experience in the works of which he treats."—*Builder*.

Locomotives.

LOCOMOTIVE ENGINES, A Rudimentary Treatise on. Comprising an Historical Sketch and Description of the Locomotive Engine. By **G. D. DEMPSEY, C.E.** With large additions treating of the MODERN LOCOMOTIVE, by **D. KINNEAR CLARK, C.E., M.I.C.E.,** Author of "Tramways, their Construction and Working," &c., &c. With numerous Illustrations. 12mo. 3s. 6d. cloth boards.

"The student cannot fail to profit largely by adopting this as his preliminary text-book."—*Iron and Coal Trades Review*.

"Seems a model of what an elementary technical book should be."—*Academy*.

Fuels and their Economy.

FUEL, its Combustion and Economy; consisting of an Abridgment of "A Treatise on the Combustion of Coal and the Prevention of Smoke." By **C. W. WILLIAMS, A.I.C.E.** With extensive additions on Recent Practice in the Combustion and Economy of Fuel—Coal, Coke, Wood, Peat, Petroleum, &c.; by **D. KINNEAR CLARK, C.E., M.I.C.E.** Second Edition, revised. With numerous Illustrations. 12mo. 4s. cloth boards. [Just published.]

"Students should buy the book and read it, as one of the most complete and satisfactory treatises on the combustion and economy of fuel to be had."—*Engineer*.

Roads and Streets.

THE CONSTRUCTION OF ROADS AND STREETS. In Two Parts. I. The Art of Constructing Common Roads. By **HENRY LAW, C.E.** Revised and Condensed by **D. KINNEAR CLARK, C.E.**—II. Recent Practice in the Construction of Roads and Streets: including Pavements of Stone, Wood, and Asphalt. By **D. KINNEAR CLARK, C.E., M.I.C.E.** Second Edition, revised. 12mo, 5s. cloth.

"A book which every borough surveyor and engineer must possess, and which will considerable service to architects, builders, and property owners generally."—*Eng. News*.

Sewing Machine (The).

SEWING MACHINERY; being a Practical Manual of the Sewing Machine, comprising its History and Details of its Construction, with full Technical Directions for the Adjusting of Sewing Machines. By J. W. URQUHART, Author of "Electro Plating: a Practical Manual;" "Electric Light: its Production and Use." With Numerous Illustrations. 12mo, 2s. 6d. cloth boards. [Just published.

Field-Book for Engineers.

THE ENGINEER'S, MINING SURVEYOR'S, and CONTRACTOR'S FIELD-BOOK. By W. DAVIS HASKOLL, C.E. Consisting of a Series of Tables, with Rules, Explanations of Systems, and Use of Theodolite for Traverse Surveying and Plotting the Work with minute accuracy by means of Straight Edge and Set Square only; Levelling with the Theodolite, Casting out and Reducing Levels to Datum, and Plotting Sections in the ordinary manner; Setting out Curves with the Theodolite by Tangential Angles and Multiples with Right and Left-hand Readings of the Instrument; Setting out Curves without Theodolite on the System of Tangential Angles by Sets of Tangents and Offsets; and Earthwork Tables to 80 feet deep, calculated for every 6 inches in depth.

With numerous woodcuts. 4th Edition, enlarged. Cr. 8vo. 12s. cloth.

"The book is very handy, and the author might have added that the separate tables of sines and tangents to every minute will make it useful for many other purposes, the genuine traverse tables existing all the same."—*Athenæum*.

"Cannot fail, from its portability and utility, to be extensively patronised by the engineering profession."—*Mining Journal*.

Earthwork, Measurement and Calculation of.

A MANUAL on EARTHWORK. By ALEX. J. S. GRAHAM, C.E., Resident Engineer, Forest of Dean Central Railway. With numerous Diagrams. 18mo, 2s. 6d. cloth.

"As a really handy book for reference, we know of no work equal to it; and the railway engineers and others employed in the measurement and calculation of earthwork will find a great amount of practical information very admirably arranged, and available for general or rough estimates, as well as for the more exact calculations required in the engineers' contractor's offices."—*Artisan*.

Drawing for Engineers, &c.

THE WORKMAN'S MANUAL OF ENGINEERING DRAWING. By JOHN MAXTON, Instructor in Engineering Drawing, Royal Naval College, Greenwich, formerly of R. S. N. A., South Kensington. Fourth Edition, carefully revised. With upwards of 300 Plates and Diagrams. 12mo, cloth, strongly bound, 4s.

"A copy of it should be kept for reference in every drawing office."—*Engineering*.

"Indispensable for teachers of engineering drawing."—*Mechanics' Magazine*.

Weale's Dictionary of Terms.

A DICTIONARY of TERMS used in ARCHITECTURE, BUILDING, ENGINEERING, MINING, METALLURGY, ARCHÆOLOGY, the FINE ARTS, &c. By JOHN WEALE. Fifth Edition, revised by ROBERT HUNT, F.R.S., Keeper of Mining Records, Editor of "Ure's Dictionary of Arts." 12mo, 6s. cl. bds.

"The best small technological dictionary in the language."—*Architect*.

"The absolute accuracy of a work of this character can only be judged of after extensive consultation, and from our examination it appears very correct and very complete."—*Mining Journal*.

MINING, METALLURGY, ETC.

Metalliferous Minerals and Mining.

A TREATISE ON METALLIFEROUS MINERALS AND MINING. By D.C. DAVIES, F.G.S., author of "A Treatise on Slate and Slate Quarrying." With numerous wood engravings. Second Edition, revised. Cr. 8vo. 12s. 6d. cloth. [*Just published.*]

"Without question, the most exhaustive and the most practically useful work we have seen: the amount of information given is enormous, and it is given concisely and intelligibly."—*Mining Journal*.

"The volume is one which no student of mineralogy should be without."—*Colliery Guardian*.

"The author has gathered together from all available sources a vast amount of really useful information. As a history of the present state of mining throughout the world this book has a real value, and it supplies an actual want, for no such information has hitherto been brought together within such limited space."—*Athenæum*.

Slate and Slate Quarrying.

A TREATISE ON SLATE AND SLATE QUARRYING, Scientific, Practical, and Commercial. By D. C. DAVIES, F.G.S., Mining Engineer, &c. With numerous Illustrations and Folding Plates. Second Edition, carefully revised. 12mo, 3s. 6d. cloth boards.

"Mr. Davies has written a useful and practical hand-book on an important industry, with all the conditions and details of which he appears familiar."—*Engineering*.

"The work is illustrated by actual practice, and is unusually thorough and lucid. Mr. Davies has completed his work with industry and skill."—*Builder*.

Metallurgy of Iron.

A TREATISE ON THE METALLURGY OF IRON: containing Outlines of the History of Iron Manufacture, Methods of Assay, and Analyses of Iron Ores, Processes of Manufacture of Iron and Steel, &c. By H. BAUERMAN, F.G.S., Associate of the Royal School of Mines. With numerous Illustrations. Fourth Edition, revised and much enlarged. 12mo, cloth boards, 5s.

"Has the merit of brevity and conciseness, as to less important points, while all material matters are very fully and thoroughly entered into."—*Standard*.

Manual of Mining Tools.

MINING TOOLS. For the use of Mine Managers, Agents, Mining Students, &c. By WILLIAM MORGANS, Lecturer on Practical Mining at the Bristol School of Mines. Volume of Text. 12mo, 3s. With an Atlas of Plates, containing 235 Illustrations. 4to, 6s. Together, 9s. cloth boards.

"Students in the Science of Mining, and Overmen, Captains, Managers, and Viewers may gain practical knowledge and useful hints by the study of Mr. Morgans' Manual."—*Colliery Guardian*.

Mining, Surveying and Valuing.

THE MINERAL SURVEYOR AND VALUER'S COMPLETE GUIDE, comprising a Treatise on Improved Mining Surveying, with new Traverse Tables; and Descriptions of Improved Instruments; also an Exposition of the Correct Principles of Laying out and Valuing Home and Foreign Iron and Coal Mineral Properties. By WILLIAM LINTERN, Mining and Civil Engineer. With four Plates of Diagrams, Plans, &c., 12mo, 4s. cloth.

"Contains much valuable information given in a small compass, and which, as far as we have tested it, is thoroughly trustworthy."—*Iron and Coal Trades Review*.

above, bound with THOMAN'S TABLES. (See page 20.)
1/2 cloth.

Coal and Coal Mining.

COAL AND COAL MINING: a Rudimentary Treatise on. By WARINGTON W. SMYTH, M.A., F.R.S., &c., Chief Inspector of the Mines of the Crown. Fifth edition, revised and corrected. 12mo, with numerous Illustrations, 4s. cloth boards.

"Every portion of the volume appears to have been prepared with much care, and as an outline is given of every known coal-field in this and other countries, as well as of the two principal methods of working, the book will doubtless interest a very large number of readers."—*Mining Journal*.

Underground Pumping Machinery.

MINE DRAINAGE; being a Complete and Practical Treatise on Direct-Acting Underground Steam Pumping Machinery, with a Description of a large number of the best known Engines, their General Utility and the Special Sphere of their Action, the Mode of their Application, and their merits compared with other forms of Pumping Machinery. By STEPHEN MICHELL, Joint-Author of "The Cornish System of Mine Drainage." 8vo. [Nearly ready.

NAVAL ARCHITECTURE, NAVIGATION, ETC.

Pocket Book for Naval Architects & Shipbuilders.

THE NAVAL ARCHITECT'S AND SHIPBUILDER'S POCKET BOOK OF FORMULÆ, RULES, AND TABLES AND MARINE ENGINEER'S AND SURVEYOR'S HANDY BOOK OF REFERENCE. By CLEMENT MACKROW, Naval Draughtsman, Associate of the Institution of Naval Architects. With numerous Diagrams, &c. Fcap., strongly bound in leather, with elastic strap for pocket, 12s. 6d.

"Should be used by all who are engaged in the construction or design of vessels."—*Engineer*.

"There is scarcely a subject on which a naval architect or shipbuilder can require to refresh his memory which will not be found within the covers of Mr. Mackrow's book."—*English Mechanic*.

"Mr. Mackrow has compressed an extraordinary amount of information into this useful volume."—*Athenæum*.

Grantham's Iron Ship-Building.

ON IRON SHIP-BUILDING; with Practical Examples and Details. Fifth Edition. Imp. 4to, boards, enlarged from 24 to 40 Plates (21 quite new), including the latest Examples. Together with separate Text, also considerably enlarged, 12mo, cloth limp. By JOHN GRANTHAM, M. Inst. C.E., &c. 2s. 2s. complete.

"Mr. Grantham's work is of great interest. It will, we are confident, command an extensive circulation among shipbuilders in general. By order of the Board of Admiralty, the work will form the text-book on which the examination in iron ship-building of candidates for promotion in the dockyards will be mainly based."—*Engineering*.

Pocket-Book for Marine Engineers.

A POCKET-BOOK OF USEFUL TABLES AND FORMULÆ FOR MARINE ENGINEERS. By FRANK PROCTOR, A.I.N.A. Second Edition, revised and enlarged. Royal 32mo, leather, gilt edges, with strap, 4s.

"A most useful companion to all marine engineers."—*United Service Gazette*.

"Scarcely anything required by a naval engineer appears to have been forgotten."—*Iron*.

Light-Houses.

EUROPEAN LIGHT-HOUSE SYSTEMS; being a Report of a Tour of Inspection made in 1873. By Major GEORGE H. ELLIOT, Corps of Engineers, U.S.A. Illustrated by 51 Engravings and 31 Woodcuts in the Text. 8vo, 21s. cloth.

Surveying (Land and Marine).

LAND AND MARINE SURVEYING, in Reference to the Preparation of Plans for Roads and Railways, Canals, Rivers, Towns' Water Supplies, Docks and Harbours; with Description and Use of Surveying Instruments. By W. DAVIS HASKOLL, C.E. With 14 folding Plates, and numerous Woodcuts. 8vo, 12s. 6d. cloth.

"A most useful and well arranged book for the aid of a student."—*Builder*.

"Of the utmost practical utility, and may be safely recommended to all students who aspire to become clean and expert surveyors."—*Mining Journal*.

Storms.

STORMS: their Nature, Classification, and Laws, with the Means of Predicting them by their Embodiments, the Clouds. By WILLIAM BLASIUS. Crown 8vo, 10s. 6d. cloth boards.

Rudimentary Navigation.

THE SAILOR'S SEA-BOOK: a Rudimentary Treatise on Navigation. By JAMES GREENWOOD, B.A. New and enlarged edition. By W. H. ROSSER. 12mo, 3s. cloth boards.

Mathematical and Nautical Tables.

MATHEMATICAL TABLES, for Trigonometrical, Astronomical, and Nautical Calculations; to which is prefixed a Treatise on Logarithms. By HENRY LAW, C.E. Together with a Series of Tables for Navigation and Nautical Astronomy. By J. R. YOUNG, formerly Professor of Mathematics in Belfast College. New Edition. 12mo, 4s. cloth boards.

Navigation (Practical), with Tables.

PRACTICAL NAVIGATION: consisting of the Sailor's Sea-Book, by JAMES GREENWOOD and W. H. ROSSER; together with the requisite Mathematical and Nautical Tables for the Working of the Problems. By HENRY LAW, C.E., and Professor J. R. YOUNG. Illustrated with numerous Wood Engravings and Coloured Plates. 12mo, 7s. strongly half bound in leather.

WEALE'S RUDIMENTARY SERIES.

The following books in Naval Architecture, etc., are published in the above series.

- MASTING, MAST-MAKING, AND RIGGING OF SHIPS. By ROBERT KIPPING, N.A. Fourteenth Edition. 12mo, 2s. 6d. cloth.
- SAILS AND SAIL-MAKING. Tenth Edition, enlarged. By ROBERT KIPPING, N.A. Illustrated. 12mo, 3s. cloth boards.
- NAVAL ARCHITECTURE. By JAMES PEAKE. Fourth Edition, with Plates and Diagrams. 12mo, 4s. cloth boards.
- MARINE ENGINES, AND STEAM VESSELS. By ROBERT FERRAY, C.E. Seventh Edition. 12mo, 3s. 6d. cloth boards.

ARCHITECTURE, BUILDING, ETC.

Construction.

THE SCIENCE of BUILDING: An Elementary Treatise on the Principles of Construction. By E. WYNDHAM TARN, M.A., Architect. With 47 Wood Engravings. Demy 8vo. 8s. 6d. cloth.

"A very valuable book, which we strongly recommend to all students."—*Builder*.

"No architectural student should be without this hand-book."—*Architect*.

Villa Architecture.

A HANDY BOOK of VILLA ARCHITECTURE; being a Series of Designs for Villa Residences in various Styles. With Detailed Specifications and Estimates. By C. WICKES, Architect, Author of "The Spires and Towers of the Mediæval Churches of England," &c. 31 Plates, 4to, half morocco, gilt edges, 1l. 1s.

* * Also an Enlarged edition of the above. 61 Plates, with Detailed Specifications, Estimates, &c. 2l. 2s. half morocco.

"The whole of the designs bear evidence of their being the work of an artistic architect, and they will prove very valuable and suggestive."—*Building News*.

Useful Text-Book for Architects.

THE ARCHITECT'S GUIDE: Being a Text-book of Useful Information for Architects, Engineers, Surveyors, Contractors, Clerks of Works, &c., &c. By FREDERICK ROGERS, Architect, Author of "Specifications for Practical Architecture," &c. With numerous Illustrations. Crown 8vo, 6s. cloth.

"As a text-book of useful information for architects, engineers, surveyors, &c., it would be hard to find a handier or more complete little volume."—*Standard*.

Taylor and Cresy's Rome.

THE ARCHITECTURAL ANTIQUITIES OF ROME. By the late G. L. TAYLOR, Esq., F.S.A., and EDWARD CRESY, Esq. New Edition, thoroughly revised, and supplemented under the editorial care of the Rev. ALEXANDER TAYLOR, M.A. (son of the late G. L. Taylor, Esq.), Chaplain of Gray's Inn. This is the only book which gives on a large scale, and with the precision of architectural measurement, the principal Monuments of Ancient Rome in plan, elevation, and detail. Large folio, with 130 Plates, half-bound, 3l. 3s.

* * Originally published in two volumes, folio, at 18l. 18s.

Vitruvius' Architecture.

THE ARCHITECTURE OF MARCUS VITRUVIUS POLLIO. Translated by JOSEPH GWILT, F.S.A., F.R.A.S. Numerous Plates. 12mo, cloth limp. 5s.

The Young Architect's Book.

HINTS TO YOUNG ARCHITECTS. By GEORGE WIGHTWICK, Architect. New Edition, revised and enlarged. By G. HUSKISSON GUILLAUME, Architect. 12mo, cloth boards, 4s.

"Will be found an acquisition to pupils, and a copy ought to be considered as necessary a purchase as a box of instruments."—*Architect*.

"A large amount of information, which young architects will do well to acquire, if they wish to succeed in the everyday work of their profession."—*English Mechanic*.

Drawing for Builders and Students.

PRACTICAL RULES ON DRAWING for the OPERATIVE BUILDER and YOUNG STUDENT in ARCHITECTURE. By GEORGE PYNE. With 14 Plates, 4to, 7s. 6d. boards.

The House-Owner's Estimator.

THE HOUSE-OWNER'S ESTIMATOR; or, What will it Cost to Build, Alter, or Repair? A Price-Book adapted to the Use of Unprofessional People as well as for the Architectural Surveyor and Builder. By the late JAMES D. SIMON, A.R.I.B.A. Edited and Revised by FRANCIS T. W. MILLER, Surveyor. With numerous Illustrations. Second Edition, with the prices carefully corrected to present time. Crown 8vo, cloth, 3s. 6d.

"In two years it will repay its cost a hundred times over."—*Field*.

"A very handy book for those who want to know what a house will cost to build, alter, or repair."—*English Mechanic*.

Boiler and Factory Chimneys.

BOILER AND FACTORY CHIMNEYS; their Draught-power and Stability, with a chapter on Lightning Conductors. By ROBERT WILSON, C.E., Author of "Treatise on Steam Boilers," &c., &c. Crown 8vo, 3s. 6d. cloth.

Civil and Ecclesiastical Building.

A BOOK ON BUILDING, CIVIL AND ECCLESIASTICAL, Including CHURCH RESTORATION. By Sir EDMUND BECKETT, Bart., LL.D., Q.C., F.R.A.S., Chancellor and Vicar-General of York. Author of "Clocks and Watches and Bells," &c. Second Edition, 12mo, 5s. cloth boards.

"A book which is always amusing and nearly always instructive. Sir E. Beckett will be read for the raciness of his style. We are able very cordially to recommend all persons to read it for themselves. The style throughout is in the highest degree condensed and epigrammatic."—*Times*.

"We commend the book to the thoughtful consideration of all who are interested in the building art."—*Builder*.

Architecture, Ancient and Modern.

RUDIMENTARY ARCHITECTURE, Ancient and Modern. Consisting of VITRUVIUS, translated by JOSEPH GWILT, F.S.A., &c., with 23 fine copper plates; GRECIAN Architecture, by the EARL of ABERDEEN; the ORDERS of Architecture, by W. H. LEEDS, Esq.; The STYLES of Architecture of Various Countries, by T. TALBOT BURY; The PRINCIPLES of DESIGN in Architecture, by E. L. GARBETT. In one volume, half-bound (pp. 1,100), copiously illustrated, 12s.

* * Sold separately, in two vols., as follows—

ANCIENT ARCHITECTURE. Containing Gwilt's Vitruvius and Aberdeen's Grecian Architecture. Price 6s. half-bound.

N.B.—This is the only edition of VITRUVIUS procurable at a moderate price.

MODERN ARCHITECTURE. Containing the Orders, by Leeds; The Styles, by Bury; and Design, by Garbett. 6s. half-bound.

House Painting.

HOUSE PAINTING, GRAINING, MARBLING, AND SIGN WRITING: a Practical Manual of. With 9 Coloured Plates of Woods and Marbles, and nearly 150 Wood Engravings. By ELLIS A. DAVIDSON, Author of "Building Construction," &c. Third Edition, carefully revised. 12mo, 6s. cloth boards.

"Contains a mass of information of use to the amateur and of value to the practical man."—*English Mechanic*.

Plumbing.

PLUMBING; a Text-book to the Practice of the Art or Craft of the Plumber. With chapters upon House-drainage, embodying the latest Improvements. By W. P. BUCHAN, Sanitary Engineer. Second Edition, enlarged, with 300 illustrations, 12mo. 4s. cloth.

"The chapters on house-drainage may be usefully consulted, not only by plumbers, but also by engineers and all engaged or interested in house-building."—*Iron*.

Handbook of Specifications.

THE HANDBOOK OF SPECIFICATIONS; or, Practical Guide to the Architect, Engineer, Surveyor, and Builder, in drawing up Specifications and Contracts for Works and Constructions. Illustrated by Precedents of Buildings actually executed by eminent Architects and Engineers. By Professor THOMAS L. DONALDSON, M.I.B.A. New Edition, in One large volume, 8vo, with upwards of 1000 pages of text, and 33 Plates, cloth, 17. 11s. 6d.

"In this work forty-four specifications of executed works are given. . . . Donaldson's Handbook of Specifications must be bought by all architects."—*Builder*.

Specifications for Practical Architecture.

SPECIFICATIONS FOR PRACTICAL ARCHITECTURE: A Guide to the Architect, Engineer, Surveyor, and Builder; with an Essay on the Structure and Science of Modern Buildings. By FREDERICK ROGERS, Architect. 8vo, 15s. cloth.

* * A volume of specifications of a practical character being greatly required, and the old standard work of Alfred Bartholomew being out of print, the author, on the basis of that work, has produced the above.—*Extract from Preface*.

Designing, Measuring, and Valuing.

THE STUDENT'S GUIDE TO THE PRACTICE OF MEASURING AND VALUING ARTIFICERS' WORKS; containing Directions for taking Dimensions, Abstracting the same, and bringing the Quantities into Bill, with Tables of Constants, and copious Memoranda for the Valuation of Labour and Materials in the respective Trades of Bricklayer and Slater, Carpenter and Joiner, Painter and Glazier, Paperhanger, &c. With 43 Plates and Woodcuts. Originally edited by EDWARD DOBSON, Architect. New Edition, re-written, with Additions on Mensuration and Construction, and useful Tables for facilitating Calculations and Measurements. By E. WYNDHAM TARN, M.A., 8vo, 10s. 6d. cloth.

"Well fulfils the promise of its title-page. Mr. Tarn's additions and revisions have much increased the usefulness of the work."—*Engineering*.

Beaton's Pocket Estimator.

THE POCKET ESTIMATOR FOR THE BUILDING TRADES, being an easy method of estimating the various parts of a Building collectively, more especially applied to Carpenters' and Joiners' work, priced according to the present value of material and labour. By A. C. BEATON, Author of "Quantities and Measurements." Second Edition. Waistcoat-pocket size. 1s. 6d.

Beaton's Builders' and Surveyors' Technical Guide.

THE POCKET TECHNICAL GUIDE AND MEASURER FOR BUILDERS AND SURVEYORS: containing a Complete Explanation of the Terms used in Building Construction, Memoranda for Reference, Technical Directions for Measuring Work in all the Building Trades, &c. By A. C. BEATON. Second Edition. Waistcoat-pocket size. 1s. 6d.

Builder's and Contractor's Price Book.

LOCKWOOD & CO.'S BUILDER'S AND CONTRACTOR'S PRICE BOOK, containing the latest prices of all kinds of Builders' Materials and Labour, and of all Trades connected with Building, &c., &c. The whole revised and edited by F. T. W. MILLER, Architect and Surveyor. Fcap. half-bound, 4s.

CARPENTRY, TIMBER, ETC.

Tredgold's Carpentry, new and cheaper Edition.

THE ELEMENTARY PRINCIPLES OF CARPENTRY: a Treatise on the Pressure and Equilibrium of Timber Framing, the Resistance of Timber, and the Construction of Floors, Arches, Bridges, Roofs, Uniting Iron and Stone with Timber, &c. To which is added an Essay on the Nature and Properties of Timber, &c., with Descriptions of the Kinds of Wood used in Building; also numerous Tables of the Scantlings of Timber for different purposes, the Specific Gravities of Materials, &c. By THOMAS TREDGOLD, C.E. Edited by PETER BARLOW, F.R.S. Fifth Edition, corrected and enlarged. With 64 Plates (11 of which now first appear in this edition), Portrait of the Author, and several Woodcuts. In 1 vol., 4to, published at 2l. 2s., reduced to 1l. 5s. cloth.

"Ought to be in every architect's and every builder's library, and those who do not already possess it ought to avail themselves of the new issue."—*Builder*.

"A work whose monumental excellence must commend it wherever skilful carpentry is concerned. The Author's principles are rather confirmed than impaired by time. The additional plates are of great intrinsic value."—*Building News*.

Grandy's Timber Tables.

THE TIMBER IMPORTER'S, TIMBER MERCHANT'S, and BUILDER'S STANDARD GUIDE. By RICHARD E. GRANDY. Comprising:—An Analysis of Deal Standards, Home and Foreign, with comparative Values and Tabular Arrangements for Fixing Nett Landed Cost on Baltic and North American Deals, including all intermediate Expenses, Freight, Insurance, &c., &c.; together with Copious Information for the Retailer and Builder. 2nd Edition. Carefully revised and corrected. 12mo, 3s. 6d. cloth.

"Everything it pretends to be: built up gradually, it leads one from a forest to a greenail, and throws in, as a makeweight, a host of material concerning bricks, columns, cisterns, &c.—all that the class to whom it appeals requires."—*English Mechanic*.

Timber Freight Book.

THE TIMBER IMPORTERS' AND SHIPOWNERS' FREIGHT BOOK: Being a Comprehensive Series of Tables for the Use of Timber Importers, Captains of Ships, Shipbrokers, Builders, and all Dealers in Wood whatsoever. By WILLIAM RICHARDSON, Timber Broker. Crown 8vo, 6s. cloth.

Tables for Packing-Case Makers.

PACKING-CASE TABLES; showing the number of Superficial Feet in Boxes or Packing-Cases, from six inches square and upwards. Compiled by WILLIAM RICHARDSON, Accountant. Second Edition. Oblong 4to, 3s. 6d. cloth.

"so much labour and calculation to packing-case makers and those who use it."—*Grocer*. "Invaluable labour-saving tables."—*Ironmonger*.

Horton's Measurer.

THE COMPLETE MEASURER; setting forth the Measurement of Boards, Glass, &c.; Unequal-sided, Square-sided, Octagonal-sided, Round Timber and Stone, and Standing Timber. With just allowances for the bark in the respective species of trees, and proper deductions for the waste in hewing the trees, &c.; also a Table showing the solidity of hewn or eight-sided timber, or of any octagonal-sided column. By RICHARD HORTON. Fourth edition, with considerable and valuable additions, 12mo, strongly bound in leather, 5s.

Horton's Underwood and Woodland Tables.

TABLES FOR PLANTING AND VALUING UNDERWOOD AND WOODLAND; also Lineal, Superficial, Cubical, and Decimal Tables, &c. By R. HORTON. 12mo, 2s. leather.

Nicholson's Carpenter's Guide.

THE CARPENTER'S NEW GUIDE; or, BOOK of LINES for CARPENTERS: comprising all the Elementary Principles essential for acquiring a knowledge of Carpentry. Founded on the late PETER NICHOLSON'S standard work. A new Edition, revised by ARTHUR ASHPITEL, F.S.A., together with Practical Rules on Drawing, by GEORGE PYNE. With 74 Plates, 4to, 1l. 1s. cloth.

Dowsing's Timber Merchant's Companion.

THE TIMBER MERCHANT'S AND BUILDER'S COMPANION; containing New and Copious Tables of the Reduced Weight and Measurement of Deals and Battens, of all sizes, from One to a Thousand Pieces, also the relative Price that each size bears per Lineal Foot to any given Price per Petersburg Standard Hundred, &c., &c. Also a variety of other valuable information. By WILLIAM DOWSING, Timber Merchant. Third Edition, Revised. Crown 8vo, 3s. cloth.

"Everything is as concise and clear as it can possibly be made. There can be no doubt that every timber merchant and builder ought to possess it."—*Hull Advertiser*.

Practical Timber Merchant.

THE PRACTICAL TIMBER MERCHANT, being a Guide for the use of Building Contractors, Surveyors, Builders, &c., comprising useful Tables for all purposes connected with the Timber Trade, Essay on the Strength of Timber, Remarks on the Growth of Timber, &c. By W. RICHARDSON. Fcap. 8vo, 3s. 6d. cl.

Woodworking Machinery.

WOODWORKING MACHINERY; its Rise, Progress, and Construction. With Hints on the Management of Saw Mills and the Economical Conversion of Timber. Illustrated with Examples of Recent Designs by leading English, French, and American Engineers. By M. POWIS BALE, M.I.M.E. Large crown 8vo, 12s. 6d. cloth. [Just published.]

"Mr. Bale is evidently an expert on the subject, and he has collected so much information that his book is all-sufficient for builders and others engaged in the construction of timber."—*Architect*.

"The most comprehensive compendium of wood-working machinery we have seen. The author is a thorough master of his subject."—*Building News*.

"It should be in the office of every wood-working factory."—*English Mechanic*.

MECHANICS, ETC.

Mechanic's Workshop Companion.

THE OPERATIVE MECHANIC'S WORKSHOP COMPANION, and THE SCIENTIFIC GENTLEMAN'S PRACTICAL ASSISTANT. By W. TEMPLETON. 12th Edit., with Mechanical Tables for Operative Smiths, Millwrights, Engineers, &c.; and an Extensive Table of Powers and Roots, 12mo, 5s. bound.

"As a text-book in which mechanical and commercial demands are judiciously met, TEMPLETON'S COMPANION stands unrivalled."—*Mechanics Magazine*.

"Admirably adapted to the wants of a very large class. It has met with great success in the engineering workshop, as we can testify; and there are a great many men who, in a great measure, owe their rise in life to this little work."—*Building News*.

Engineer's and Machinist's Assistant.

THE ENGINEER'S, MILLWRIGHT'S, and MACHINIST'S PRACTICAL ASSISTANT; comprising a Collection of Useful Tables, Rules, and Data. Compiled and Arranged, with Original Matter, by WM. TEMPLETON. 6th Edition. 18mo, 2s. 6d. cloth.

"A more suitable present to an apprentice to any of the mechanical trades could not possibly be made."—*Building News*.

Superficial Measurement.

THE TRADESMAN'S GUIDE TO SUPERFICIAL MEASUREMENT. Tables calculated from 1 to 200 inches in length, by 1 to 108 inches in breadth. For the use of Architects, Engineers, Timber Merchants, Builders, &c. By J. HAWKINGS. Fcp. 3s. 6d. cl.

The High-Pressure Steam Engine.

THE HIGH-PRESSURE STEAM ENGINE; an Exposition of its Comparative Merits, and an Essay towards an Improved System of Construction, adapted especially to secure Safety and Economy. By Dr. ERNST ALBAN, Practical Machine Maker, Plau, Mecklenberg. Translated from the German, with Notes, by Dr. POLE, F.R.S., M.I.C.E., &c. With 28 Plates, 8vo, 16s. 6d. cl.

Steam Boilers.

A TREATISE ON STEAM BOILERS: their Strength, Construction, and Economical Working. By R. WILSON, C.E. Fifth Edition. 12mo, 6s. cloth.

"The best work on boilers which has come under our notice."—*Engineering*.

"The best treatise that has ever been published on steam boilers."—*Engineer*.

Power in Motion.

POWER IN MOTION: Horse Power, Toothed Wheel Gearing, Long and Short Driving Bands, Angular Forces, &c. By JAMES ARMOUR, C.E. With 73 Diagrams. 12mo, 3s. cloth.

Mechanics.

THE HANDBOOK OF MECHANICS. By DIONYSIUS LARDNER, D.C.L., formerly Professor of Natural Philosophy and Astronomy in University College, London. New Edition, Edited and considerably Enlarged, by BENJAMIN LOEWY, F.R.A.S., &c., &c. With 378 Illustrations, post 8vo, 6s. cloth.

"The explanations throughout are studiously popular, and care has been taken to show the application of the various branches of physics to the industrial arts, and to practical business of life."—*Mining Journal*.

MATHEMATICS, TABLES, ETC.

Gregory's Practical Mathematics.

MATHEMATICS for PRACTICAL MEN ; being a Common-place Book of Pure and Mixed Mathematics. Designed chiefly for the Use of Civil Engineers, Architects, and Surveyors. Part I.

PURE MATHEMATICS—comprising Arithmetic, Algebra, Geometry, Mensuration, Trigonometry, Conic Sections, Properties of Curves. Part II. MIXED MATHEMATICS—comprising Mechanics in general, Statics, Dynamics, Hydrostatics, Hydrodynamics, Pneumatics, Mechanical Agents, Strength of Materials. With an Appendix of copious Logarithmic and other Tables. By OLINTHUS GREGORY, LL.D., F.R.A.S. Enlarged by HENRY LAW, C.E. 4th Edition, carefully revised and corrected by J. R. YOUNG, formerly Professor of Mathematics, Belfast Coll. With 13 Plates. 8vo, 17. 1s. cloth.

"The engineer or architect will here find ready to his hand, rules for solving nearly every mathematical difficulty that may arise in his practice. The rules are in all cases explained by means of examples clearly worked out."—*Builder*.

"One of the most serviceable books for practical mechanics. . . ."—*Building News*.

The Metric System.

A SERIES OF METRIC TABLES, in which the British Standard Measures and Weights are compared with those of the Metric System at present in use on the Continent. By C. H. DOWLING, C.E. 2nd Edit., revised and enlarged. 8vo, 10s. 6d. cl.

"Their accuracy has been certified by Prof. Airy, Astronomer-Royal."—*Builder*.

Inwood's Tables, greatly enlarged and improved.

TABLES FOR THE PURCHASING of ESTATES, Freehold, Copyhold, or Leasehold; Annuities, Advowsons, &c., and for the Renewing of Leases held under Cathedral Churches, Colleges, or other corporate bodies; for Terms of Years certain, and for Lives; also for Valuing Reversionary Estates, Deferred Annuities, Next Presentations, &c., together with Smart's Five Tables of Compound Interest, and an Extension of the same to Lower and Intermediate Rates. By WILLIAM INWOOD, Architect. The 21st edition, with considerable additions, and new and valuable Tables of Logarithms for the more Difficult Computations of the Interest of Money, Discount, Annuities, &c., by M. FÉDOR THOMAN, of the Société Crédit Mobilier of Paris. 12mo, 8s. cloth.

"Those interested in the purchase and sale of estates, and in the adjustment of compensation cases, as well as in transactions in annuities, life insurances, &c., will find the present edition of eminent service."—*Engineering*.

Geometry for the Architect, Engineer, &c.

PRACTICAL GEOMETRY, for the Architect, Engineer, and Mechanic; giving Rules for the Delineation and Application of various Geometrical Lines, Figures and Curves. By E. W. TARN, M.A., Architect, Author of "The Science of Building," &c. With 164 Illustrations. Demy 8vo. 12s. 6d. cloth.

Mathematical Instruments.

MATHEMATICAL INSTRUMENTS: Their Construction, Adjustment, Testing, and Use; comprising Drawing, Measuring, Optical, Surveying, and Astronomical Instruments. By J. F. HEATHER, M.A. Enlarged Edition, for the most part re-written. Numerous Woodcuts. 12mo, 5s. cloth.

Compound Interest and Annuities.

THEORY OF COMPOUND INTEREST AND ANNUITIES; with Tables of Logarithms for the more Difficult Computations of Interest, Discount, Annuities, &c., in all their Applications and Uses for Mercantile and State Purposes. By FÉDOR THOMAN, of the Société Crédit Mobilier, Paris. 3rd Edit., 12mo, 4s. 6d. cl.

"A very powerful work, and the Author has a very remarkable command of his subject."—*Professor A. de Morgan.*

Iron and Metal Trades' Calculator.

THE IRON AND METAL TRADES' COMPANION: Being a Calculator containing a Series of Tables upon a new and comprehensive plan for expeditiously ascertaining the value of any goods bought or sold by weight, from 1s. per cwt. to 112s. per cwt., and from one farthing per lb. to 1s. per lb. Each Table extends from one lb. to 100 tons. By T. DOWNIE. 396 pp., 9s., leather.

"A most useful set of tables, and will supply a want, for nothing like them before existed."—*Building News.*

Iron and Steel.

'IRON AND STEEL': a Work for the Forge, Foundry, Factory, and Office. Containing Information for Ironmasters and their Stocktakers; Managers of Bar, Rail, Plate, and Sheet Rolling Mills; Iron and Metal Founders; Iron Ship and Bridge Builders; Mechanical, Mining, and Consulting Engineers; Architects, Builders, &c. By CHARLES HOARE, Author of 'The Slide Rule,' &c. Eighth Edition. With folding Scales of "Foreign Measures compared with the English Foot," and "fixed Scales of Squares, Cubes, and Roots, Areas, Decimal Equivalents, &c." Oblong, 32mo, 6s., leather, elastic-band.

"For comprehensiveness the book has not its equal."—*Iron.*

Comprehensive Weight Calculator.

THE WEIGHT CALCULATOR; being a Series of Tables upon a New and Comprehensive Plan, exhibiting at one Reference the exact Value of any Weight from 1 lb. to 15 tons, at 300 Progressive Rates, from 1 Penny to 168 Shillings per cwt., and containing 186,000 Direct Answers, which, with their Combinations, consisting of a single addition (mostly to be performed at sight), will afford an aggregate of 10,266,000 Answers; the whole being calculated and designed to ensure Correctness and promote Despatch. By HENRY HARBEN, Accountant, Sheffield. New Edition. Royal 8vo, 1l. 5s., strongly half-bound.

Comprehensive Discount Guide.

THE DISCOUNT GUIDE: comprising several Series of Tables for the use of Merchants, Manufacturers, Ironmongers, and others, by which may be ascertained the exact profit arising from any mode of using Discounts, either in the Purchase or Sale of Goods, and the method of either Altering a Rate of Discount, or Advancing a Price, so as to produce, by one operation, a sum that will realise any required profit after allowing one or more Discounts: to which are added Tables of Profit or Advance from $1\frac{1}{2}$ to 90 per cent., Tables of Discount from $1\frac{1}{2}$ to $98\frac{1}{2}$ per cent., and Tables of Commission, &c., from $\frac{1}{2}$ to 10 per cent. By HENRY HARBEN, Accountant. New Edition, Demy 8vo. £1 5s., half-bound.

SCIENCE AND ART.

Dentistry.

MECHANICAL DENTISTRY. A Practical Treatise on the Construction of the various kinds of Artificial Dentures. Comprising also Useful Formulæ, Tables, and Receipts for Gold Plate, Clasps, Solders, etc., etc. By CHARLES HUNTER. With numerous Wood Engravings. Crown 8vo, 7s. 6d. cloth.

"The work is very practical."—*Monthly Review of Dental Surgery.*

"An authoritative treatise We can strongly recommend Mr. Hunter's treatise to all students preparing for the profession of dentistry, as well as to every mechanical dentist."—*Dublin Journal of Medical Science.*

"The best book on the subject with which we are acquainted."—*Medical Press and Circular.*

Brewing.

A HANDBOOK FOR YOUNG BREWERS. By HERBERT EDWARDS WRIGHT, B.A. Crown 8vo, 3s. 6d. cloth.

"A thoroughly scientific treatise in popular language. It is evident that the author has mastered his subject in its scientific aspects."—*Morning Advertiser.*

"We would particularly recommend teachers of the art to place it in every pupil's hands, and we feel sure its perusal will be attended with advantage."—*Brewer.*

Gold and Gold-Working.

THE GOLDSMITH'S HANDBOOK : containing full instructions for the Alloying and Working of Gold. Including the Art of Alloying, Melting, Reducing, Colouring, Collecting and Refining. The processes of Manipulation, Recovery of Waste, Chemical and Physical Properties of Gold, with a new System of Mixing its Alloys ; Solders, Enamels, and other useful Rules and Recipes, &c. By GEORGE E. GEE, Goldsmith and Silversmith. Second Edition, considerably enlarged. 12mo, 3s. 6d. cloth boards.

"A good, sound, technical educator, and will be generally accepted as an authority. It gives full particulars for mixing alloys and enamels, is essentially a book for the workshop, and exactly fulfils the purpose intended."—*Horological Journal.*

"The best work yet printed on its subject for a reasonable price. We have no doubt that it will speedily become a standard book which few will care to be without."—*Jeweller and Metalworker.*

"We consider that the trade owes not a little to Mr. Gee, who has in two volumes compressed almost the whole of its literature, and we doubt not that many a young beginner will owe a part of his future success to a diligent study of the pages which are peculiarly well adapted to his use."—*Clerkenwell Press.*

"It is essentially a practical manual, intended primarily for the use of working jewellers, but is well adapted to the wants of amateurs and apprentices, containing, as it does, trustworthy information that only a practical man can supply."—*English Mechanic.*

Silver and Silver Working.

THE SILVERSMITH'S HANDBOOK, containing full Instructions for the Alloying and Working of Silver, including the different modes of refining and melting the metal, its solders, the preparation of imitation alloys, methods of manipulation, prevention of waste, instructions for improving and finishing the surface of the work, together with other useful information and memoranda. By GEORGE E. GEE, Jeweller, &c. 12mo, 3s. 6d. cloth boards.

"This work is destined to take up as good a position in technical literature as the *Practical Goldworker*, a book which has passed through the ordeal of critical examination and business tests with great success."—*Jeweller and Metalworker.*

"The chief merit of the work is its practical character. The workers in the trade will speedily discover its merits when they sit down to study it."—*English Mechanic.*

"This work forms a valuable sequel to the author's *Practical Goldworker*, and supplies a want long felt in the silver trade."—*Silversmith's Trade Journal.*

Electric Lighting.

ELECTRIC LIGHT: Its Production and Use, embodying plain Directions for the Working of Galvanic Batteries, Electric Lamps, and Dynamo-Electric Machines. By J. W. URQUHART, C. E., Author of "Electroplating: a Practical Handbook." Edited by F. C. WEBB, M.I.C.E., M.S.T.E., With 94 Illustrations. Crown 8vo, 7s. 6d. cloth. [Just published.]

"It is the only work at present available, which gives in language intelligible for the most part to the ordinary reader, a general but concise history of the means which have been adopted up to the present time in producing the electric light."—*Metropolitan*.

"An important addition to the literature of the electric light. Students of the subject should not fail to read it."—*Colliery Guardian*.

"As a popular and practical treatise on the subject, the volume may be thoroughly recommended."—*Bristol Mercury*.

Electroplating, etc.

ELECTROPLATING: A Practical Handbook, including the Practice of Electrotyping. By J. W. URQUHART, C.E. With numerous Illustrations. Crown 8vo, 5s. cloth.

"The volume is without a rival in its particular sphere, and the lucid style in which it is written commends it to those amateurs and experimental electrotypers who have but slight, if any, knowledge of the processes of the art to which they turn their attention."—*Design and Work*.

"A large amount of thoroughly practical information."—*Telegraphic Journal*.

"An excellent practical manual."—*Engineering*.

"The information given appears to be based on direct personal knowledge. . . . Its science is sound, and the style is always clear."—*Athenæum*.

"Any ordinarily intelligent person may become an adept in electro-deposition with a very little science indeed, and this is the book to show him or her the way."—*Builder*.

The Military Sciences.

AIDE-MÉMOIRE to the MILITARY SCIENCES. Framed from Contributions of Officers and others connected with the different Services. Originally edited by a Committee of the Corps of Royal Engineers. Second Edition, most carefully revised by an Officer of the Corps, with many additions; containing nearly 350 Engravings and many hundred Woodcuts. 3 vols. royal 8vo, extra cloth boards, and lettered, 4l. 10s.

"A compendious encyclopædia of military knowledge."—*Edinburgh Review*.

"The most comprehensive work of reference to the military and collateral sciences."—*Volunteer Service Gazette*.

Field Fortification.

A TREATISE on FIELD FORTIFICATION, the ATTACK of FORTRESSES, MILITARY MINING, and RECONNOITRING. By Colonel I. S. MACAULAY, late Professor of Fortification in the R. M. A., Woolwich. Sixth Edition, crown 8vo, cloth, with separate Atlas of 12 Plates, 12s. complete.

Dye-Wares and Colours.

THE MANUAL of COLOURS and DYE-WARES: their Properties, Applications, Valuation, Impurities, and Sophistications. For the Use of Dyers, Printers, Drysalters, Brokers, &c. By J. W. SLATER. Post 8vo, 7s. 6d. cloth.

"A complete encyclopædia of the *materia tinctoria*. The information is full and precise, and the methods of determining the value of articles liable to sophistication, are practical as well as valuable."—*Chemist and Druggist*.

The Alkali Trade—Sulphuric Acid, etc.

A MANUAL OF THE ALKALI TRADE, including the Manufacture of Sulphuric Acid, Sulphate of Soda, and Bleaching Powder. By JOHN LOMAS, Alkali Manufacturer, Newcastle-upon-Tyne and London. With 232 Illustrations and Working Drawings, and containing 386 pages of text. Super-royal 8vo, 2l 12s. 6d. cloth. [Just published.]

This work provides (1) a Complete Handbook for intending Alkali and Sulphuric Acid Manufacturers, and for those already in the field who desire to improve their plant, or to become practically acquainted with the latest processes and developments of the trade; (2) a Handy Volume which Manufacturers can put into the hands of their Managers and Foremen as a useful guide in their daily rounds of duty.

SYNOPSIS OF CONTENTS.

Chap. I. Choice of Site and General Plan of Works—II. Sulphuric Acid—III. Recovery of the Nitrogen Compounds, and Treatment of Small Pyrites—IV. The Salt Cake Process—V. Legislation upon the Noxious Vapours Question—VI. The Hargreaves' and Jones' Processes—VII. The Balling Process—VIII. Lixiviation and Salting Down—	IX. Carbonating or Finishing—X. Soda Crystals—XI. Refined Alkali—XII. Caustic Soda—XIII. Bi-carbonate of Soda—XIV. Bleaching Powder—XV. Utilisation of Tank Waste—XVI. General Remarks—Four Appendices, treating of Yields, Sulphuric Acid Calculations, Anemometers, and Foreign Legislation upon the Noxious Vapours Question.
--	---

"The author has given the fullest, most practical, and, to all concerned in the alkali trade, most valuable mass of information that, to our knowledge, has been published in any language."—*Engineer*.

"This book is written by a manufacturer for manufacturers. The working details of the most approved forms of apparatus are given, and these are accompanied by no less than 232 wood engravings, all of which may be used for the purposes of construction. Every step in the manufacture is very fully described in this manual, and each improvement explained. Everything which tends to introduce economy into the technical details of this trade receives the fullest attention. The book has been produced with great completeness."—*Athenæum*.

"The author is not one of those clever compilers who, on short notice, will 'read up' any conceivable subject, but a practical man in the best sense of the word. We find here not merely a sound and luminous explanation of the chemical principles of the trade, but a notice of numerous matters which have a most important bearing on the successful conduct of alkali works, but which are generally overlooked by even the most experienced technological authors. This most valuable book, which we trust will be generally appreciated, we must pronounce a credit alike to its author and to the enterprising firm who have undertaken its publication."—*Chemical Review*.

Chemical Analysis.

THE COMMERCIAL HANDBOOK of CHEMICAL ANALYSIS; or Practical Instructions for the determination of the Intrinsic or Commercial Value of Substances used in Manufactures, in Trades, and in the Arts. By A. NORMANDY, Author of "Practical Introduction to Rose's Chemistry," and Editor of Rose's "Treatise on Chemical Analysis." *New Edition*. Enlarged, and to a great extent re-written, by HENRY M. NOAD, Ph. D., F.R.S. With numerous Illustrations. Cr. 8vo, 12s. 6d. cloth.

"We recommend this book to the careful perusal of every one; it may be truly affirmed to be of universal interest, and we strongly recommend it to our readers as a guide, alike indispensable to the housewife as to the pharmaceutical practitioner."—*Medical Times*.

"Essential to the analysts appointed under the new Act. The most recent facts are given, and the work is well edited and carefully written."—*Nature*.

Dr. Lardner's Museum of Science and Art.

THE MUSEUM OF SCIENCE AND ART. Edited by DIONYSIUS LARDNER, D.C.L., formerly Professor of Natural Philosophy and Astronomy in University College, London. With upwards of 1200 Engravings on Wood. In 6 Double Volumes. Price £1 1s., in a new and elegant cloth binding, or handsomely bound in half morocco, 31s. 6d.

OPINIONS OF THE PRESS.

"This series besides affording popular but sound instruction on scientific subjects, with which the humblest man in the country ought to be acquainted, also undertakes that teaching of 'common things' which every well-wisher of his kind is anxious to promote. Many thousand copies of this serviceable publication have been printed, in the belief and hope that the desire for instruction and improvement widely prevails; and we have no fear that such enlightened faith will meet with disappointment."—*Times*.

"A cheap and interesting publication, alike informing and attractive. The papers combine subjects of importance and great scientific knowledge, considerable inductive powers, and a popular style of treatment."—*Spectator*.

"The 'Museum of Science and Art' is the most valuable contribution that has ever been made to the Scientific Instruction of every class of society."—*Sir David Brewster in the North British Review*.

"Whether we consider the liberality and beauty of the illustrations, the charm of the writing, or the durable interest of the matter, we must express our belief that there is hardly to be found among the new books, one that would be welcomed by people of so many ages and classes as a valuable present."—*Examiner*.

* * *Separate books formed from the above, suitable for Workmen's Libraries, Science Classes, &c.*

COMMON THINGS EXPLAINED. Containing Air, Earth, Fire, Water, Time, Man, the Eye, Locomotion, Colour, Clocks and Watches, &c. 233 Illustrations, cloth gilt, 5s.

THE MICROSCOPE. Containing Optical Images, Magnifying Glasses, Origin and Description of the Microscope, Microscopic Objects, the Solar Microscope, Microscopic Drawing and Engraving, &c. 147 Illustrations, cloth gilt, 2s.

POPULAR GEOLOGY. Containing Earthquakes and Volcanoes, the Crust of the Earth, etc. 201 Illustrations, cloth gilt, 2s. 6d.

POPULAR PHYSICS. Containing Magnitude and Minuteness, the Atmosphere, Meteoric Stones, Popular Fallacies, Weather Prognostics, the Thermometer, the Barometer, Sound, &c. 85 Illustrations, cloth gilt, 2s. 6d.

STEAM AND ITS USES. Including the Steam Engine, the Locomotive, and Steam Navigation. 89 Illustrations, cloth gilt, 2s.

POPULAR ASTRONOMY. Containing How to Observe the Heavens. The Earth, Sun, Moon, Planets. Light, Comets, Eclipses, Astronomical Influences, &c. 182 Illustrations, 4s. 6d.

THE BEE AND WHITE ANTS: Their Manners and Habits. With Illustrations of Animal Instinct and Intelligence. 135 Illustrations, cloth gilt, 2s.

THE ELECTRIC TELEGRAPH POPULARISED. To render intelligible to all who can Read, irrespective of any previous Scientific Acquirements, the various forms of Telegraphy in Actual Operation. 100 Illustrations, cloth gilt, 1s. 6d.

Dr. Lardner's Handbooks of Natural Philosophy.

* * The following five volumes, though each is Complete in itself, and to be purchased separately, form A COMPLETE COURSE OF NATURAL PHILOSOPHY, and are intended for the general reader who desires to attain accurate knowledge of the various departments of Physical Science, without pursuing them according to the more profound methods of mathematical investigation. The style is studiously popular. It has been the author's aim to supply Manuals such as are required by the Student, the Engineer, the Artisan, and the superior classes in Schools.

THE HANDBOOK OF MECHANICS. Enlarged and almost rewritten by BENJAMIN LOEWY, F.R.A.S. With 378 Illustrations. Post 8vo, 6s. cloth.

"The perspicuity of the original has been retained, and chapters which had become obsolete, have been replaced by others of more modern character. The explanations throughout are studiously popular, and care has been taken to show the application of the various branches of physics to the industrial arts, and to the practical business of life."—*Mining Journal*.

THE HANDBOOK OF HYDROSTATICS and PNEUMATICS. New Edition, Revised and Enlarged by BENJAMIN LOEWY, F.R.A.S. With 236 Illustrations. Post 8vo, 5s. cloth.

"For those 'who desire to attain an accurate knowledge of physical science without the profound methods of mathematical investigation, this work is not merely intended, but well adapted.'"—*Chemical News*.

THE HANDBOOK OF HEAT. Edited and almost entirely Rewritten by BENJAMIN LOEWY, F.R.A.S., etc. 117 Illustrations. Post 8vo, 6s. cloth.

"The style is always clear and precise, and conveys instruction without leaving any cloudiness or lurking doubts behind."—*Engineering*.

THE HANDBOOK OF OPTICS. New Edition. Edited by T. OLVER HARDING, B.A. 298 Illustrations. Post 8vo, 5s. cloth.

"Written by one of the ablest English scientific writers, beautifully and elaborately illustrated."—*Mechanics Magazine*.

THE HANDBOOK OF ELECTRICITY, MAGNETISM, and ACOUSTICS. New Edition. Edited by GEO. CAREY FOSTER, B.A., F.C.S. With 400 Illustrations. Post 8vo, 5s. cloth.

"The book could not have been entrusted to any one better calculated to preserve the terse and lucid style of Lardner, while correcting his errors and bringing up his work to the present state of scientific knowledge."—*Popular Science Review*.

Dr. Lardner's Handbook of Astronomy.

THE HANDBOOK OF ASTRONOMY. Forming a Companion to the "Handbooks of Natural Philosophy." By DIONYSIUS LARDNER, D.C.L., formerly Professor of Natural Philosophy and Astronomy in University College, London. Fourth Edition. Revised and Edited by EDWIN DUNKIN, F.R.S., Royal Observatory, Greenwich. With 38 Plates and upwards of 100 Woodcuts. In 1 vol., small 8vo, 550 pages, 9s. 6d., cloth.

"Probably no other book contains the same amount of information in so compendious and well-arranged a form—certainly none at the price at which this is offered to the public."—*Athenæum*.

"We can do no other than pronounce this work a most valuable manual of astronomy, and we strongly recommend it to all who wish to acquire a general—but at the same time correct—acquaintance with this sublime science."—*Quarterly Journal of Science*.

Dr. Lardner's Handbook of Animal Physics.

THE HANDBOOK OF ANIMAL PHYSICS. By DR. LARDNER. With 520 Illustrations. New edition, small 8vo, cloth, 732 pages, 7s. 6d.

"We have no hesitation in cordially recommending it."—*Educational Times*.

Dr. Lardner's School Handbooks.

NATURAL PHILOSOPHY FOR SCHOOLS. By DR. LARDNER.
328 Illustrations. Sixth Edition. 1 vol. 3s. 6d. cloth.

"Conveys, in clear and precise terms, general notions of all the principal divisions of Physical Science."—*British Quarterly Review*.

ANIMAL PHYSIOLOGY FOR SCHOOLS. By DR. LARDNER.

With 190 Illustrations. Second Edition. 1 vol. 3s. 6d. cloth.

"Clearly written, well arranged, and excellently illustrated."—*Gardener's Chronicle*.

Dr. Lardner's Electric Telegraph.

THE ELECTRIC TELEGRAPH. By DR. LARDNER. New Edition. Revised and Re-written, by E. B. BRIGHT, F.R.A.S.
140 Illustrations. Small 8vo, 2s. 6d. cloth.

"One of the most readable books extant on the Electric Telegraph."—*Eng. Mechanic*.

Electricity.

A MANUAL OF ELECTRICITY; including Galvanism, Magnetism, Diamagnetism, Electro-Dynamics, Magneto-Electricity, and the Electric Telegraph. By HENRY M. NOAD, Ph.D., F.C.S.
Fourth Edition, with 500 Woodcuts. 8vo, 1l. 4s. cloth.

"The accounts given of electricity and galvanism are not only complete in a scientific sense, but, which is a rarer thing, are popular and interesting."—*Lancet*.

Text-Book of Electricity.

THE STUDENT'S TEXT-BOOK OF ELECTRICITY. By HENRY M. NOAD, Ph.D., F.R.S., F.C.S. New Edition, carefully Revised. With an Introduction and Additional Chapters by W. H. PREECE, M.I.C.E., Vice-President of the Society of Telegraph Engineers, &c. With 470 Illustrations. Crown 8vo, 12s. 6d. cloth. [Just published.]

"A reflex of the existing state of Electrical Science adapted for students."—W. H. PREECE, Esq., vide "Introduction."

"We can recommend Dr. Noad's book for clear style, great range of subject, a good index, and a plethora of woodcuts. Such collections as the present are indispensable."—*Athenæum*.

"An admirable text-book for every student—beginner or advanced—of electricity."—*Engineering*.

"A most elaborate compilation of the facts of electricity and magnetism."—*Popular Science Review*.

"May be recommended to students as one of the best text-books on the subject that they can have. . . . Mr. Preece appears to have introduced all the newest inventions in the shape of telegraphic, telephonic, and electric-lighting apparatus."—*English Mechanic*.

"The work contains everything that the student can require, it is well illustrated, clearly written, and possesses a good index."—*Academy*.

"One of the best and most useful compendiums of any branch of science in our literature."—*Iron*.

"Under the editorial hand of Mr. Preece the late Dr. Noad's text-book of electricity has grown into an admirable handbook."—*Westminster Review*.

Geology and Genesis.

THE TWIN RECORDS OF CREATION: or, Geology and Genesis, their Perfect Harmony and Wonderful Concord. By GEORGE W. VICTOR LE VAUX. Numerous Illustrations. Fcap. 8vo, 5s. cloth.

"A valuable contribution to the evidences of revelation, and disposes very conclusively of the arguments of those who would set God's Works against God's Word. ~~Every~~ difficulty is shirked, and no sophistry is left unexposed."—*The Rock*.

Science and Scripture.

SCIENCE ELUCIDATIVE OF SCRIPTURE, AND NOT ANTAGONISTIC TO IT; being a Series of Essays on—1. Alleged Discrepancies; 2. The Theory of the Geologists and Figure of the Earth; 3. The Mosaic Cosmogony; 4. Miracles in general—Views of Hume and Powell; 5. The Miracle of Joshua—Views of Dr. Colenso: The Supernaturally Impossible; 6. The Age of the Fixed Stars, &c. By Prof. J. R. YOUNG. Fcap. 5s. cl.

Geology.

A CLASS-BOOK OF GEOLOGY. Consisting of "Physical Geology," which sets forth the Leading Principles of the Science; and "Historical Geology," which treats of the Mineral and Organic Conditions of the Earth at each successive epoch, especial reference being made to the British Series of Rocks. By RALPH TATE. With more than 250 Illustrations. Fcap. 8vo, 5s. cloth.

Practical Philosophy.

A SYNOPSIS OF PRACTICAL PHILOSOPHY. By Rev. JOHN CARR, M.A., late Fellow of Trin. Coll., Camb. 18mo, 5s. cl.

Mollusca.

A MANUAL OF THE MOLLUSCA; being a Treatise on Recent and Fossil Shells. By Dr. S. P. WOODWARD, A.L.S. With Appendix by RALPH TATE, A.L.S., F.G.S. With numerous Plates and 300 Woodcuts. 3rd Edition. Cr. 8vo, 7s. 6d. cloth.

Clocks, Watches, and Bells.

RUDIMENTARY TREATISE ON CLOCKS, and WATCHES, and BELLS. By Sir EDMUND BECKETT, Bart. (late E. B. Denison), LL.D., Q.C., F.R.A.S. Sixth edition, revised and enlarged. Limp cloth (No. 67, Weale's Series), 4s. 6d.; cloth bds. 5s. 6d.

"As a popular and practical treatise it is unapproached."—*English Mechanic*.

"The best work on the subject probably extant. The treatise on bells is undoubtedly the best in the language."—*Engineering*.

"The only modern treatise on clock-making."—*Horological Journal*.

Grammar of Colouring.

A GRAMMAR OF COLOURING, applied to Decorative Painting and the Arts. By GEORGE FIELD. New edition, enlarged. By ELLIS A. DAVIDSON. With new Coloured Diagrams and Engravings. 12mo, 3s. 6d. cloth.

"The book is a most useful *résumé* of the properties of pigments."—*Builder*.

Pictures and Painters.

THE PICTURE AMATEUR'S HANDBOOK AND DICTIONARY OF PAINTERS: A Guide for Visitors to Picture Galleries, and for Art-Students, including methods of Painting, Cleaning, Re-Lining, and Restoring, Principal Schools of Painting, Copyists and Imitators. By PHILIPPE DARYL, B.A. Cr. 8vo, 3s. 6d. cl.

Woods and Marbles (Imitation of).

SCHOOL OF PAINTING FOR THE IMITATION OF WOODS AND MARBLES, as Taught and Practised by A. R. and P. VAN DER BURG, Directors of the Rotterdam Painting Institution. Illustrated with 24 full-size Coloured Plates; 12 Plain Plates, comprising 154 Figures. Folio, 2l. 12s. 6d.

Delamotte's Works on Illumination & Alphabets.

A PRIMER OF THE ART OF ILLUMINATION; for the use of Beginners: with a Rudimentary Treatise on the Art, Practical Directions for its Exercise, and numerous Examples taken from Illuminated MSS., printed in Gold and Colours. By F. DELAMOTTE. Small 4to, 9s. Elegantly bound, cloth antique.

"The examples of ancient MSS. recommended to the student, which, with much good sense, the author chooses from collections accessible to all, are selected with judgment and knowledge, as well as taste."—*Athenæum*.

ORNAMENTAL ALPHABETS, ANCIENT and MEDIÆVAL; from the Eighth Century, with Numerals; including Gothic, Church-Text, German, Italian, Arabesque, Initials, Monograms, Crosses, &c. Collected and engraved by F. DELAMOTTE, and printed in Colours. New and Cheaper Edition. Royal 8vo, oblong, 2s. 6d. ornamental boards.

"For those who insert enamelled sentences round gilded chalices, who blazon shop legends over shop-doors, who letter church walls with pithy sentences from the Decalogue, this book will be useful."—*Athenæum*.

EXAMPLES OF MODERN ALPHABETS, PLAIN and ORNAMENTAL; including German, Old English, Saxon, Italic, Perspective, Greek, Hebrew, Court Hand, Engrossing, Tuscan, Riband, Gothic, Rustic, and Arabesque, &c., &c. Collected and engraved by F. DELAMOTTE, and printed in Colours. New and Cheaper Edition. Royal 8vo, oblong, 2s. 6d. ornamental boards.

"There is comprised in it every possible shape into which the letters of the alphabet and numerals can be formed."—*Standard*.

MEDIÆVAL ALPHABETS AND INITIALS FOR ILLUMINATORS. By F. DELAMOTTE. Containing 21 Plates, and Illuminated Title, printed in Gold and Colours. With an Introduction by J. WILLIS BROOKS. Small 4to, 6s. cloth gilt.

THE EMBROIDERER'S BOOK OF DESIGN; containing Initials, Emblems, Cyphers, Monograms, Ornamental Borders, Ecclesiastical Devices, Mediæval and Modern Alphabets, and National Emblems. Collected and engraved by F. DELAMOTTE, and printed in Colours. Oblong royal 8vo, 1s. 6d. in ornamental boards.

Wood-Carving.

INSTRUCTIONS in WOOD-CARVING, for Amateurs; with Hints on Design. By A LADY. In emblematic wrapper, handsomely printed, with Ten large Plates, 2s. 6d.

"The handicraft of the wood-carver, so well as a book can impart it, may be learnt from 'A Lady's' publication."—*Athenæum*.

Popular Work on Painting.

PAINTING POPULARLY EXPLAINED; with Historical Sketches of the Progress of the Art. By THOMAS JOHN GULLICK, Painter, and JOHN TIMBS, F.S.A. Fourth Edition, revised and enlarged. With Frontispiece and Vignette. In small 8vo, 6s. cloth.

"* * * This Work has been adopted as a Prize-book in the Schools of Art at South Kensington.

"Contains a large amount of original matter, agreeably conveyed."—*Builder*.

"Much may be learned, even by those who fancy they do not require to be taught, from the careful perusal of this unpretending but comprehensive treatise."—*Art Journal*.

AGRICULTURE, GARDENING, ETC.

Youatt and Burn's Complete Grazier.

THE COMPLETE GRAZIER, and FARMER'S and CATTLE-BREEDER'S ASSISTANT. A Compendium of Husbandry. By WILLIAM YOUATT, ESQ., V.S. 12th Edition, very considerably enlarged, and brought up to the present requirements of agricultural practice. By ROBERT SCOTT BURN. One large 8vo. volume, 860 pp. with 244 Illustrations. 17. 1s. half-bound.

"The standard and text-book, with the farmer and grazier."—*Farmer's Magazine*.
 "A treatise which will remain a standard work on the subject as long as British agriculture endures."—*Mark Lane Express*.

History, Structure, and Diseases of Sheep.

SHEEP; THE HISTORY, STRUCTURE, ECONOMY, AND DISEASES OF. By W. C. SPOONER, M.R.V.C., &c. Fourth Edition, with fine engravings, including specimens of New and Improved Breeds. 366 pp., 4s. cloth.

Production of Meat.

MEAT PRODUCTION. A Manual for Producers, Distributors, and Consumers of Butchers' Meat. Being a treatise on means of increasing its Home Production. Also comprehensively treating of the Breeding, Rearing, Fattening, and Slaughtering of Meat-yielding Live Stock; Indications of the Quality; Means for Preserving, Curing, and Cooking of the Meat, etc. BY JOHN EWART. Numerous Illustrations. Cr. 8vo, 5s. cloth.

"A compact and handy volume on the meat question, which deserves serious and thoughtful consideration at the present time."—*Meat and Provision Trades Review*.

Donaldson and Burn's Suburban Farming.

SUBURBAN FARMING. A Treatise on the Laying Out and Cultivation of Farms adapted to the produce of Milk, Butter and Cheese, Eggs, Poultry, and Pigs. By the late Professor JOHN DONALDSON. With considerable Additions, Illustrating the more Modern Practice, by R. SCOTT BURN. With Illustrations. Crown 8vo, 6s. cloth.

Modern Farming.

OUTLINES OF MODERN FARMING. By R. SCOTT BURN. Soils, Manures, and Crops—Farming and Farming Economy—Cattle, Sheep, and Horses—Management of the Dairy, Pigs, and Poultry—Utilisation of Town Sewage, Irrigation, &c. New Edition. In 1 vol. 1250 pp., half-bound, profusely illustrated, 12s.

"There is sufficient stated within the limits of this treatise to prevent a farmer from going far wrong in any of his operations."—*Observer*.

Amateur Farming.

THE LESSONS OF MY FARM: a Book for Amateur Agriculturists, being an Introduction to Farm Practice, in the Culture of Crops, the Feeding of Cattle, Management of the Dairy, Poultry, Pigs, &c. By R. SCOTT BURN. With numerous Illus. Fcp. 6s. 2d.

"A complete introduction to the whole round of farming practice."—*John Bu*

"We are glad to be able to recommend it."—*Builder*.

"The advice is thoroughly practical."—*Law Journal*.

Weale's Rudimentary Series.

PHILADELPHIA, 1876.
THE PRIZE MEDAL

Was awarded to the Publishers for
Books: Rudimentary, Scientific,
"WEALE'S SERIES," ETC.

A NEW LIST OF

WEALE'S SERIES

RUDIMENTARY SCIENTIFIC, EDUCATIONAL,
AND CLASSICAL.

Comprising nearly Three Hundred and Fifty distinct works in almost every department of Science, Art, and Education, recommended to the notice of Engineers, Architects, Builders, Artisans, and Students generally, as well as to those interested in Workmen's Libraries, Literary and Scientific Institutions, Colleges, Schools, Science Classes, &c., &c.

“WEALE'S SERIES includes Text-Books on almost every branch of Science and Industry, comprising such subjects as Agriculture, Architecture and Building, Civil Engineering, Fine Arts, Mechanics and Mechanical Engineering, Physical and Chemical Science, and many miscellaneous Treatises. The whole are constantly undergoing revision, and new editions, brought up to the latest discoveries in scientific research, are constantly issued. The prices at which they are sold are as low as their excellence is assured.”—*American Literary Gazette*.

“Amongst the literature of technical education, WEALE'S SERIES has ever enjoyed a high reputation, and the additions being made by Messrs. CROSBY LOCKWOOD & CO. render the series even more complete, and bring the information upon the several subjects down to the present time.”—*Mining Journal*.

“It is impossible to do otherwise than bear testimony to the value of WEALE'S SERIES.”—*Engineer*.

“Everybody—even that outrageous nuisance ‘Every Schoolboy’—knows the merits of ‘WEALE'S RUDIMENTARY SERIES.’ Any persons wishing to acquire knowledge cannot do better than look through Weale's Series and get all the books they require. The Series is indeed an inexhaustible mine of literary wealth.”—*The Metropolitan*.

“WEALE'S SERIES has become a standard as well as an unrivalled collection of treatises in all branches of art and science.”—*Public Opinion*.

LONDON, 1862.
THE PRIZE MEDAL

Was awarded to the Publishers of

35. **THE BLASTING AND QUARRYING OF STONE**, for Building and other Purposes. With Remarks on the Blowing up of Bridges. By Gen. Sir JOHN BURGVOYNE, Bart., K.C.B. Illustrated. 1s. 6d.
62. **RAILWAY CONSTRUCTION**, Elementary and Practical Instructions on the Science of. By Sir M. STEPHENSON, C.E. New Edition, by EDWARD NUGENT, C.E. With Statistics of the Capital, Dividends, and Working of Railways in the United Kingdom. By E. D. CHATTAWAY. 4s.
- 80*. **EMBANKING LANDS FROM THE SEA**, the Practice of. Treated as a Means of Profitable Employment for Capital. With Examples and Particulars of actual Embankments, and also Practical Remarks on the Repair of old Sea Walls. By JOHN WIGGINS, F.G.S. New Edition. 2s.
81. **WATER WORKS**, for the Supply of Cities and Towns. With a Description of the Principal Geological Formations of England as influencing Supplies of Water; and Details of Engines and Pumping Machinery for raising Water. By SAMUEL HUGHES, F.G.S., C.E. New Edition. 4s.†
117. **SUBTERRANEAN SURVEYING**, an Elementary and Practical Treatise on. By THOMAS FENWICK. Also the Method of Conducting Subterranean Surveys without the Use of the Magnetic Needle, and other Modern Improvements. By THOMAS BAKER, C.E. Illustrated. 2s. 6d.†
118. **CIVIL ENGINEERING IN NORTH AMERICA**, a Sketch of. By DAVID STEVENSON, F.R.S.E., &c. Plates and Diagrams. 3s.
197. **ROADS AND STREETS (THE CONSTRUCTION OF)**, in two Parts: I. THE ART OF CONSTRUCTING COMMON ROADS, by HENRY LAW, C.E., revised and condensed by D. KINNEAR CLARK, C.E.; II. RECENT PRACTICE, including pavements of Stone, Wood, and Asphalte. Second Edition, revised, by D. K. CLARK, M.I.C.E. 4s. 6d.†
203. **SANITARY WORK IN THE SMALLER TOWNS AND IN VILLAGES.** Comprising:—1. Some of the more Common Forms of Nuisance and their Remedies; 2. Drainage; 3. Water Supply. A useful book for Members of Local Boards and Rural Sanitary Authorities, Health Officers, Engineers, Surveyors, &c. By CHARLES SLAGO, A.I.C.E. 2s. 6d.†
212. **THE CONSTRUCTION OF GAS-WORKS**, and the Manufacture and Distribution of Coal Gas. Originally written by SAMUEL HUGHES, C.E. Sixth Edition, re-written and much Enlarged by WILLIAM RICHARDS, C.E. With 72 Illustrations. 4s. 6d.† [Just published.
213. **PIONEER ENGINEERING.** A Treatise on the Engineering Operations connected with the Settlement of Waste Lands in New Countries. By EDWARD DOBSON, Assoc. Inst. C.E., Author of "The Art of Building," &c. 4s. 6d.† [Just published.

 The † indicates that these vols. may be had strongly bound at 6d. extra.

LONDON: CROSBY LOCKWOOD AND CO.,

MECHANICAL ENGINEERING, ETC.

33. *CRANES*, the Construction of, and other Machinery for Raising Heavy Bodies for the Erection of Buildings, and for Hoisting Goods. By JOSEPH GLYNN, F.R.S., &c. Illustrated. 1s. 6d.
34. *THE STEAM ENGINE*, a Rudimentary Treatise on. By Dr. LARDNER. Illustrated. 1s. 6d.
59. *STEAM BOILERS: their Construction and Management*. By R. ARMSTRONG, C.E. Illustrated. 1s. 6d.
67. *CLOCKS, WATCHES, AND BELLS*, a Rudimentary Treatise on. By Sir EDMUND BECKETT (late EDMUND BECKETT DENISON), LL.D., Q.C. A New, Revised, and considerably Enlarged Edition (the 6th), with very numerous Illustrations. 4s. 6d. cloth limp; 5s. 6d. cloth boards, gilt.
82. *THE POWER OF WATER*, as applied to drive Flour Mills, and to give motion to Turbines and other Hydrostatic Engines. By JOSEPH GLYNN, F.R.S., &c. New Edition, Illustrated. 2s.†
98. *PRACTICAL MECHANISM*, the Elements of; and Machine Tools. By T. BAKER, C.E. With Remarks on Tools and Machinery, by J. NASMYTH, C.E. Plates. 2s. 6d.†
114. *MACHINERY*, Elementary Principles of, in its Construction and Working. By C. D. ABEL, C.E. 1s. 6d.
139. *THE STEAM ENGINE*, a Treatise on the Mathematical Theory of, with Rules and Examples for Practical Men. By T. BAKER, C.E. 1s. 6d.
162. *THE BRASS FOUNDER'S MANUAL*; Instructions for Modelling, Pattern-Making, Moulding, Turning, Filing, Burnishing, Bronzing, &c. With copious Receipts, numerous Tables, and Notes on Prime Costs and Estimates. By WALTER GRAHAM. Illustrated. 2s.†
164. *MODERN WORKSHOP PRACTICE*, as applied to Marine, Land, and Locomotive Engines, Floating Docks, Dredging Machines, Bridges, Cranes, Ship-building, &c., &c. By J. G. WINTON. Illustrated. 3s.†
165. *IRON AND HEAT*, exhibiting the Principles concerned in the Construction of Iron Beams, Pillars, and Bridge Girders, and the Action of Heat in the Smelting Furnace. By J. ARMOUR, C.E. 2s. 6d.†
166. *POWER IN MOTION: Horse-Power, Toothed-Wheel Gearing, Long and Short Driving Bands, and Angular Forces*. By J. ARMOUR, 2s. 6d.†
167. *IRON BRIDGES, GIRDERS, ROOFS, AND OTHER WORKS*. By FRANCIS CAMPIN, C.E. 2s. 6d.†
171. *THE WORKMAN'S MANUAL OF ENGINEERING DRAWING*. By JOHN MAXTON, Engineer. Fourth Edition. Illustrated with 7 Plates and nearly 350 Woodcuts. 3s. 6d.†
190. *STEAM AND THE STEAM ENGINE*, Stationary and Portable. Being an extension of Mr. John Sewell's "Treatise on Steam." By D. K. CLARK, M.I.C.E. Second Edition, revised. 3s. 6d.†
200. *FUEL*, its Combustion and Economy. By C. W. WILLIAMS, A.I.C.E. With extensive additions on Recent Practice in the Combustion and Economy of Fuel—Coal, Coke, Wood, Peat, Petroleum, &c.—by D. K. CLARK, M.I.C.E. 2nd Edition. 3s. 6d.† [Just published.]
202. *LOCOMOTIVE ENGINES*. By G. D. DEMPSEY, C.E.; with large additions treating of the Modern Locomotive, by D. KINNEAR CLARK, M.I.C.E. 3s.†
211. *THE BOILERMAKER'S ASSISTANT* in Drawing, Tempering, and Calculating Boiler and Tank Work, with Rules for the Evaporative Power and the Horse Power of Steam Boilers, and the Proportions of Safety-Valves; and useful Tables of Rivet Joints, of Circles, Weights of Metals, &c. By JOHN COURTNEY, Practical Boiler Maker. Edited by D. K. CLARK, C.E. 100 Illustrations. 2s. [Just published.]
216. *MATERIALS AND CONSTRUCTION: A Theoretical and Practical Treatise on the Strains, Designing, and Erection of Works of Construction*. By FRANCIS CAMPIN, C.E., Author of "Mechanical Engineering," &c., &c. 3s.† [Just published.]
217. *SEWING MACHINERY*, being a Practical Manual of the Sewing Machine; comprising its History and Details of its Construction, with full Technical Directions for the Adjusting of Sewing Machines. By J. W. URQUHART, C.E., Author of "Electro-Plating," &c., with numerous Illustrations. 2s.† [Just published.]

† The † indicates that these vols. may be had strongly bound at 6d. extra.

SHIPBUILDING, NAVIGATION, MARINE ENGINEERING, ETC.

51. **NAVAL ARCHITECTURE**, the Rudiments of; or an Exposition of the Elementary Principles of the Science, and their Practical Application to Naval Construction. Compiled for the Use of Beginners. By JAMES PRAKE, School of Naval Architecture, H.M. Dockyard, Portsmouth. Fourth Edition, corrected, with Plates and Diagrams. 3s. 6d.†
- 53*. **SHIPS FOR OCEAN AND RIVER SERVICE**, Elementary and Practical Principles of the Construction of. By HAKON A. SOMMERFELDT, Surveyor of the Royal Norwegian Navy. With an Appendix. 1s. 6d.
- 53**. **AN ATLAS OF ENGRAVINGS** to Illustrate the above. Twelve large folding plates. Royal 4to, cloth. 7s. 6d.
54. **MASTING, MAST-MAKING, AND RIGGING OF SHIPS**, Rudimentary Treatise on. Also Tables of Spars, Rigging, Blocks; Chain, Wire, and Hemp Ropes, &c., relative to every class of vessels. With an Appendix of Dimensions of Masts and Yards of the Royal Navy. By ROBERT KIPPING, N.A. Fourteenth Edition. Illustrated. 2s.†
- 54*. **IRON SHIP-BUILDING**. With Practical Examples and Details for the Use of Ship Owners and Ship Builders. By JOHN GRANTHAM, Consulting Engineer and Naval Architect. 5th Edition, with Additions. 4s.
- 54**. **AN ATLAS OF FORTY PLATES** to Illustrate the above. Fifth Edition. Including the latest Examples, such as H.M. Steam Frigates "Warrior," "Hercules," "Bellerophon;" H.M. Troop Ship "Serapis," Iron Floating Dock, &c., &c. 4to, boards. 38s.
55. **THE SAILOR'S SEA BOOK: a Rudimentary Treatise on Navigation**. Part I. How to Keep the Log and Work it off. Part II. On Finding the Latitude and Longitude. By JAMES GREENWOOD, B.A. To which are added, the Deviation and Error of the Compass; Great Circle Sailing; the International (Commercial) Code of Signals; the Rule of the Road at Sea; Rocket and Mortar Apparatus for Saving Life; the Law of Storms; and a Brief Dictionary of Sea Terms. With numerous Woodcuts and Coloured Plates of Flags. New, thoroughly revised and much enlarged edition. By W. H. ROSSER. 2s. 6d.† [Just published.]
80. **MARINE ENGINES, AND STEAM VESSELS**, a Treatise on. Together with Practical Remarks on the Screw and Propelling Power, as used in the Royal and Merchant Navy. By ROBERT MURRAY, C.E., Engineer-Surveyor to the Board of Trade. With a Glossary of Technical Terms, and their Equivalents in French, German, and Spanish. Seventh Edition, revised and enlarged. Illustrated. 3s.†
- 83bis. **THE FORMS OF SHIPS AND BOATS: Hints, Experimentally Derived**, on some of the Principles regulating Ship-building. By W. BLAND. Seventh Edition, revised, with numerous Illustrations and Models. 1s. 6d.
99. **NAVIGATION AND NAUTICAL ASTRONOMY**, in Theory and Practice. With Attempts to facilitate the Finding of the Time and the Longitude at Sea. By J. R. YOUNG, formerly Professor of Mathematics in Belfast College. Illustrated. 2s. 6d.
- 100*. **TABLES** intended to facilitate the Operations of Navigation and Nautical Astronomy, as an Accompaniment to the above Book. By J. R. YOUNG. 1s. 6d.
106. **SHIPS' ANCHORS**, a Treatise on. By G. COTSELL, N.A. 1s. 6d.
149. **SAILS AND SAIL-MAKING**, an Elementary Treatise on. With Draughting, and the Centre of Effort of the Sails. Also, Weights and Sizes of Ropes; Mastings, Rigging, and Sails of Steam Vessels, &c., &c. Eleventh Edition, enlarged, with an Appendix. By ROBERT KIPPING, N.A., Sailmaker, Quayside, Newcastle. Illustrated. 2s. 6d.†
155. **THE ENGINEER'S GUIDE TO THE ROYAL AND MERCANTILE NAVIES**. By a PRACTICAL ENGINEER. Revised by D. F. MCCARTHY, late of the Ordnance Survey Office, Southampton. 3s.
- 55 & 204. **PRACTICAL NAVIGATION**. Consisting of The Sailor's Sea-Book. By JAMES GREENWOOD and W. H. ROSSER. Together with the requisite Mathematical and Nautical Tables for the Working of the Problems. By HENRY LAW, C.E., and J. R. YOUNG, formerly Professor of Mathematics in Belfast College. Illustrated with numerous Wood Engravings and Coloured Plates. 7s. Strongly half-bound in leather.

 The † indicates that these vols. may be had strongly bound at 6d. extra.

LONDON: CROSBY LOCKWOOD AND CO.,

PHYSICAL SCIENCE, NATURAL PHILOSOPHY, ETC.

1. **CHEMISTRY**, for the Use of Beginners. By Professor GEORGE FOWNES, F.R.S. With an Appendix on the Application of Chemistry to Agriculture. 1s.
2. **NATURAL PHILOSOPHY**, Introduction to the Study of; for the Use of Beginners. By C. TOMLINSON, Lecturer on Natural Science in King's College School, London. Woodcuts. 1s. 6d.
4. **MINERALOGY**, Rudiments of; a concise View of the Properties of Minerals. By A. RAMSAY, Jun. Woodcuts and Steel Plates. 3s. 1/2
6. **MECHANICS**, Rudimentary Treatise on; being a concise Exposition of the General Principles of Mechanical Science, and their Applications. By CHARLES TOMLINSON. Illustrated. 1s. 6d.
7. **ELECTRICITY**; showing the General Principles of Electrical Science, and the purposes to which it has been applied. By Sir W. SNOW HARRIS, F.R.S., &c. With Additions by R. SABINE, C.E., F.S.A. 1s. 6d.
- 7*. **GALVANISM**, Rudimentary Treatise on, and the General Principles of Animal and Voltaic Electricity. By Sir W. SNOW HARRIS. New Edition, with considerable Additions by ROBERT SABINE, C.E., F.S.A. 1s. 6d.
8. **MAGNETISM**; being a concise Exposition of the General Principles of Magnetical Science, and the Purposes to which it has been applied. By Sir W. SNOW HARRIS. New Edition, revised and enlarged by H. M. NOAD, Ph.D., Vice-President of the Chemical Society, Author of "A Manual of Electricity," &c., &c. With 165 Woodcuts. 3s. 6d. 1/2
11. **THE ELECTRIC TELEGRAPH**; its History and Progress; with Descriptions of some of the Apparatus. By R. SABINE, C.E., F.S.A. 3s.
12. **PNEUMATICS**, for the Use of Beginners. By CHARLES TOMLINSON. Illustrated. 1s. 6d.
72. **MANUAL OF THE MOLLUSCA**; a Treatise on Recent and Fossil Shells. By Dr. S. P. WOODWARD, A.L.S. Fourth Edition. With Appendix by RALPH TATE, A.L.S., F.G.S. With numerous Plates and 300 Woodcuts. 6s. 6d. Cloth boards, 7s. 6d.
- 79**. **PHOTOGRAPHY**, Popular Treatise on; with a Description of the Stereoscope, &c. Translated from the French of D. VAN MONCKHOVEN, by W. H. THORNTHWAITTE, Ph.D. Woodcuts. 1s. 6d.
96. **ASTRONOMY**. By the Rev. R. MAIN, M.A., F.R.S., &c. New Edition, with an Appendix on "Spectrum Analysis." Woodcuts. 1s. 6d.
97. **STATICS AND DYNAMICS**, the Principles and Practice of; embracing also a clear development of Hydrostatics, Hydrodynamics, and Central Forces. By T. BAKER, C.E. 1s. 6d.
138. **TELEGRAPHY**, Handbook of the; a Manual of Telegraphy, Telegraph Clerks' Remembrancer, and Guide to Candidates for Employment in the Telegraph Service. By R. BOND. Fourth Edition, revised and enlarged: to which is appended, QUESTIONS on MAGNETISM, ELECTRICITY, and PRACTICAL TELEGRAPHY, for the Use of Students, by W. MCGREGOR, First Assistant Supnt., Indian Gov. Telegraphs. 3s. 1/2
143. **EXPERIMENTAL ESSAYS**. By CHARLES TOMLINSON. I. On the Motions of Camphor on Water. II. On the Motion of Camphor towards the Light. III. History of the Modern Theory of Dew. Woodcuts. 1s.
173. **PHYSICAL GEOLOGY**, partly based on Major-General PORTLOCK's "Rudiments of Geology." By RALPH TATE, A.L.S., &c. Woodcuts. 2s.
174. **HISTORICAL GEOLOGY**, partly based on Major-General PORTLOCK's "Rudiments." By RALPH TATE, A.L.S., &c. Woodcuts. 2s. 6d.
173. **RUDIMENTARY TREATISE ON GEOLOGY**, Physical and Historical. Partly based on Major-General PORTLOCK's "Rudiments of Geology." By RALPH TATE, A.L.S., F.G.S., &c. In One Volume. 4s. 6d. 1/2
174. **ANIMAL PHYSICS**, Handbook of. By Dr. LARDNER, D.C.L., &c. formerly Professor of Natural Philosophy and Astronomy in University College, Lond. With 520 Illustrations. In One Vol. 7s. 6d., cloth boards.
184. * * * Sold also in Two Parts, as follows:—
 183. **ANIMAL PHYSICS**. By Dr. LARDNER. Part I., Chapters I.—VII. 4s.
 184. **ANIMAL PHYSICS**. By Dr. LARDNER. Part II., Chapters VIII.—XVIII. 3s.

 The † indicates that these vols. may be had strongly bound at 6d. extra

7, STATIONERS' HALL COURT, LUDGATE HILL, E.C.

MINING, METALLURGY, ETC.

117. **SUBTERRANEAN SURVEYING**, Elementary and Practical Treatise on, with and without the Magnetic Needle. By THOMAS FENWICK, Surveyor of Mines, and THOMAS BAKER, C.E. Illustrated. 2s. 6d.†
133. **METALLURGY OF COPPER**; an Introduction to the Methods of Seeking, Mining, and Assaying Copper, and Manufacturing its Alloys. By ROBERT H. LAMBORN, Ph.D. Woodcuts. 2s. 6d.†
134. **METALLURGY OF SILVER AND LEAD**. A Description of the Ores; their Assay and Treatment, and valuable Constituents. By Dr. R. H. LAMBORN. Woodcuts. 2s. 6d.†
135. **ELECTRO-METALLURGY**; Practically Treated. By ALEXANDER WATT, F.R.S.S.A. 7th Edition, revised, with important additions, including the Electro-Deposition of Nickel, &c. Woodcuts. 3s.†
172. **MINING TOOLS**, Manual of. For the Use of Mine Managers, Agents, Students, &c. By WILLIAM MORGANS. 2s. 6d.†
- 172*. **MINING TOOLS, ATLAS** of Engravings to Illustrate the above, containing 235 Illustrations, drawn to Scale. 4to. 4s. 6d.; cloth boards, 6s.
176. **METALLURGY OF IRON**. Containing History of Iron Manufacture, Methods of Assay, and Analyses of Iron Ores, Processes of Manufacture of Iron and Steel, &c. By H. BAUERMAN, F.G.S. 4th Edition. 4s. 6d.†
180. **COAL AND COAL MINING**, A Rudimentary Treatise on. By WARINGTON W. SMYTH, M.A., F.R.S. Fifth Edition, revised and enlarged. With numerous Illustrations. 3s. 6d.† [Just published.]
195. **THE MINERAL SURVEYOR AND VALUER'S COMPLETE GUIDE**, with new Traverse Tables, and Descriptions of Improved Instruments; also the Correct Principles of Laying out and Valuing Mineral Properties. By WILLIAM LINTERN, Mining and Civil Engineer. 3s. 6d.†
214. **A TREATISE ON SLATE AND SLATE QUARRYING**, Scientific, Practical, and Commercial. By D. C. DAVIES, F.G.S., Mining Engineer, &c. With numerous Illustrations and Folding Plates. 3s.†
215. **THE GOLDSMITH'S HANDBOOK**, containing full Instructions for the Alloying and Working of Gold, including the Art of Alloying, Melting, Reducing, Colouring, Collecting, and Refining; Chemical and Physical Properties of Gold; with a New System of Mixing its Alloys; Solders, Enamels, &c. By GEORGE E. GEE, Goldsmith and Silversmith. Second Edition, considerably enlarged. 3s.† [Just published.]
220. **THE SILVERSMITH'S HANDBOOK**, containing full Instructions for the Alloying and Working of Silver. By GEORGE E. GEE. 3s.†
219. **MAGNETIC SURVEYING, AND ANGULAR SURVEYING**, with Records of the Peculiarities of Needle Disturbances. Compiled from the Results of carefully made Experiments. By WILLIAM LINTERN, Mining and Civil Engineer and Surveyor. 2s. [Just published.]

FINE ARTS.

20. **PERSPECTIVE FOR BEGINNERS**. Adapted to Young Students and Amateurs in Architecture, Painting, &c. By GEORGE PYNE. 2s.
40. **GLASS STAINING**; or, The Art of Painting on Glass. From the German of Dr. GESSERT. With an Appendix on THE ART OF ENAMELLING, &c.; together with THE ART OF PAINTING ON GLASS. From the German of EMANUEL OTTO FROMBERG. In One Volume. 2s. 6d.
41. **MUSIC**, A Rudimentary and Practical Treatise on. With numerous Examples. By CHARLES CHILD SPENCER. 2s. 6d.
71. **PIANOFORTE**, The Art of Playing the. With numerous Exercises & Lessons. From the Best Masters, by CHARLES CHILD SPENCER. 1s. 6d.
181. **PAINTING POPULARLY EXPLAINED**, including Fresco, Oil, Mosaic, Water Colour, Water-Glass, Tempera, Encaustic, Miniature, Painting on Ivory, Vellum, Pottery, Enamel, Glass, &c. With Historical Sketches of the Progress of the Art by THOMAS JOHN GULLICK, assisted by JOHN TIMMS, F.S.A. Fourth Edition, revised and enlarged. 5s.†
186. **A GRAMMAR OF COLOURING**, applied to Decorative Painting and the Arts. By GEORGE FIELD. New Edition, enlarged and adapted to the Use of the Ornamental Painter and Designer. By ELLIS A. DAVIDSON. With two new Coloured Diagrams, &c. 3s.†

65 The † indicates that these vols. may be had strongly bound at 6d. extra.

AGRICULTURE, GARDENING, ETC.

29. **THE DRAINAGE OF DISTRICTS AND LANDS.** By G. DRYSDALE DEMPSEY, C.E. *[New Edition in preparation.]*
66. **CLAY LANDS AND LOAMY SOILS.** By Professor DONALDSON. 1s.
131. **MILLER'S, MERCHANT'S, AND FARMER'S READY RECKONER**, for ascertaining at sight the value of any quantity of Corn, from One Bushel to One Hundred Quarters, at any given price, from £1 to £5 per Qr. With approximate values of Millstones, Millwork, &c. 1s.
140. **SOILS, MANURES, AND CROPS.** (Vol. 1. OUTLINES OF MODERN FARMING.) By R. SCOTT BURN. Woodcuts. 2s.
141. **FARMING & FARMING ECONOMY**, Notes, Historical and Practical, on. (Vol. 2. OUTLINES OF MODERN FARMING.) By R. SCOTT BURN. 3s.
142. **STOCK; CATTLE, SHEEP, AND HORSES.** (Vol. 3. OUTLINES OF MODERN FARMING.) By R. SCOTT BURN. Woodcuts. 2s. 6d.
145. **DAIRY, PIGS, AND POULTRY**, Management of the. By R. SCOTT BURN. With Notes on the Diseases of Stock. (Vol. 4. OUTLINES OF MODERN FARMING.) Woodcuts. 2s.
146. **UTILIZATION OF SEWAGE, IRRIGATION, AND RECLAMATION OF WASTE LAND.** (Vol. 5. OUTLINES OF MODERN FARMING.) By R. SCOTT BURN. Woodcuts. 2s. 6d.
- * Nos. 140-1-2-5-6, in One Vol., handsomely half-bound, entitled "OUTLINES OF MODERN FARMING." By ROBERT SCOTT BURN. Price 12s.
177. **FRUIT TREES**, The Scientific and Profitable Culture of. From the French of DU BREUIL. Revised by GEO. GLENNY. 187 Woodcuts. 3s. 6d.†
198. **SHEEP; THE HISTORY, STRUCTURE, ECONOMY, AND DISEASES OF.** By W. C. SPOONER, M.R.V.C., &c. Fourth Edition, considerably enlarged; with numerous fine engravings, including some specimens of New and Improved Breeds. 366 pp. 3s. 6d.†
201. **KITCHEN GARDENING MADE EASY.** Showing how to prepare and lay out the ground, the best means of cultivating every known Vegetable and Herb, with cultural directions for the management of them all the year round. By GEORGE M.F. GLENNY, Author of "Floriculture," &c. 1s. 6d.†
207. **OUTLINES OF FARM MANAGEMENT, and the Organization of Farm Labour:** Treating of the General Work of the Farm; Field and Live Stock; Details of Contract Work; Specialities of Labour; Economical Management of the Farmhouse and Cottage, and their Domestic Animals. By ROBERT SCOTT BURN. 2s. 6d.† *[Just published.]*
208. **OUTLINES OF LANDED ESTATES MANAGEMENT:** Treating of the Varieties of Lands on the Estate; Peculiarities of its Farms; Methods of Farming; the Setting-out of Farms and their Fields; the Construction of Roads, Fences, Gates, and the various Farm Buildings; the several Classes of Waste or Unproductive Lands; Irrigation; Drainage, Plantation, &c. By R. SCOTT BURN. 2s. 6d.† *[Just published.]*
- * Nos. 207 & 208 in One Vol., handsomely half-bound, entitled "OUTLINES OF LANDED ESTATES AND FARM MANAGEMENT." By R. SCOTT BURN. Price 6s.
209. **THE TREE PLANTER AND PLANT PROPAGATOR:** Being a Practical Manual on the Propagation of Forest Trees, Fruit Trees, Flowering Shrubs, Flowering Plants, Pot-Herbs, &c.; with numerous Illustrations of Grafting, Layering, Budding, Cuttings, &c., Useful Implements, Houses, Pits, &c. By SAMUEL WOOD. 2s.† *[Just published.]*
210. **THE TREE PRUNER:** Being a Practical Manual on the Pruning of Fruit Trees, including also their Training and Renovation, with the Best Method of bringing Old and Worn-out Trees into a State of Bearing; also treating of the Pruning of Shrubs, Climbers and Flowering Plants. By SAMUEL WOOD. 2s.† *[Just published.]*
- * Nos. 209 & 210 in One Vol., handsomely half-bound, entitled "THE TREE PLANTER, PROPAGATOR AND PRUNER." By SAMUEL WOOD. Price 5s.
219. **THE HAY AND STRAW MEASURER:** Being New Tables for the Use of Auctioneers, Valuers, Farmers, Hay and Straw Dealers, &c., being a complete Calculator and Ready-Reckoner, especially adapted to persons connected with Agriculture. Third Edition. By JOHN STEELE. 2s. *[Just published.]*

† The † indicates that these vols. may be had strongly bound at 6d. extra

ARITHMETIC, GEOMETRY, MATHEMATICS, ETC.

32. **MATHEMATICAL INSTRUMENTS**, a Treatise on; in which their Construction and the Methods of Testing, Adjusting, and Using them are concisely Explained. By J. F. HEATHER, M.A., of the Royal Military Academy, Woolwich. Original Edition, in 1 vol., Illustrated. 1s. 6d.
- *.* *In ordering the above, be careful to say, "Original Edition" (No. 32), to distinguish it from the Enlarged Edition in 3 vols. (Nos. 168-9-70.)*
60. **LAND AND ENGINEERING SURVEYING**, a Treatise on; with all the Modern Improvements. Arranged for the Use of Schools and Private Students; also for Practical Land Surveyors and Engineers. By T. BAKER, C.E. New Edition, revised by EDWARD NUGENT, C.E. Illustrated with Plates and Diagrams. 2s. 4
- 61*. **READY RECKONER FOR THE ADMEASUREMENT OF LAND**. By ABRAHAM ARMAN, Schoolmaster, Thurleigh, Beds. To which is added a Table, showing the Price of Work, from 2s. 6d. to £1 per acre, and Tables for the Valuation of Land, from 1s. to £1,000 per acre, and from one pole to two thousand acres in extent, &c., &c. 1s. 6d.
76. **DESCRIPTIVE GEOMETRY**, an Elementary Treatise on; with a Theory of Shadows and of Perspective, extracted from the French of G. MONGE. To which is added, a description of the Principles and Practice of Isometrical Projection; the whole being intended as an introduction to the Application of Descriptive Geometry to various branches of the Arts. By J. F. HEATHER, M.A. Illustrated with 14 Plates. 2s.
178. **PRACTICAL PLANE GEOMETRY**: giving the Simplest Modes of Constructing Figures contained in one Plane and Geometrical Construction of the Ground. By J. F. HEATHER, M.A. With 215 Woodcuts. 2s.
179. **PROJECTION**: Orthographic, Topographic, and Perspective: giving the various Modes of Delineating Solid Forms by Constructions on a Single Plane Surface. By J. F. HEATHER, M.A. [*In preparation.*]
- *.* *The above three volumes will form a COMPLETE ELEMENTARY COURSE OF MATHEMATICAL DRAWING.*
83. **COMMERCIAL BOOK-KEEPING**. With Commercial Phrases and Forms in English, French, Italian, and German. By JAMES HADDON, M.A., Arithmetical Master of King's College School, London. 1s. 6d.
84. **ARITHMETIC**, a Rudimentary Treatise on: with full Explanations of its Theoretical Principles, and numerous Examples for Practice. For the Use of Schools and for Self-Instruction. By J. R. YOUNG, late Professor of Mathematics in Belfast College. New Edition, with Index. 1s. 6d.
- 84*. A KEY to the above, containing Solutions in full to the Exercises, together with Comments, Explanations, and Improved Processes, for the Use of Teachers and Unassisted Learners. By J. R. YOUNG. 1s. 6d.
85. **EQUATIONAL ARITHMETIC**, applied to Questions of Interest,
- 85*. Annuities, Life Assurance, and General Commerce; with various Tables by which all Calculations may be greatly facilitated. By W. HIPPSLEY. 2s.
86. **ALGEBRA**, the Elements of. By JAMES HADDON, M.A., Second Mathematical Master of King's College School. With Appendix, containing miscellaneous Investigations, and a Collection of Problems in various parts of Algebra. 2s.
- 86*. A KEY AND COMPANION to the above Book, forming an extensive repository of Solved Examples and Problems in Illustration of the various Expedients necessary in Algebraical Operations. Especially adapted for Self-Instruction. By J. R. YOUNG. 1s. 6d.
88. **EUCLID, THE ELEMENTS OF**: with many additional Propositions and Explanatory Notes: to which is prefixed, an Introductory Essay on Logic. By HENRY LAW, C.E. 2s. 6d. 4
- *.* *Sold also separately, viz. :-*
88. EUCLID, The First Three Books. By HENRY LAW, C.E. 1s. 6d.
89. EUCLID, Books 4, 5, 6, 11, 12. By HENRY LAW, C.E. 1s. 6d.

 The 4 indicates that these vols. may be had strongly bound at 6d. extra.

LONDON: CROSBY LOCKWOOD AND CO.,

Arithmetic, Geometry, Mathematics, etc., *continued.*

90. **ANALYTICAL GEOMETRY AND CONIC SECTIONS**, a Rudimentary Treatise on. By JAMES HANN, late Mathematical Master of King's College School, London. A New Edition, re-written and enlarged by J. R. YOUNG, formerly Professor of Mathematics at Belfast College. 2s. ‡
91. **PLANE TRIGONOMETRY**, the Elements of. By JAMES HANN, formerly Mathematical Master of King's College, London. 1s. 6d.
92. **SPHERICAL TRIGONOMETRY**, the Elements of. By JAMES HANN. Revised by CHARLES H. DOWLING, C.E. 1s.
 * Or with "*The Elements of Plane Trigonometry*," in *One Volume*, 2s. 6d.
93. **MENSURATION AND MEASURING**, for Students and Practical Use. With the Mensuration and Levelling of Land for the Purposes of Modern Engineering. By T. BAKER, C.E. New Edition, with Corrections and Additions by E. NUGENT, C.E. Illustrated. 1s. 6d.
- 101*. **MEASURES, WEIGHTS, AND MONEYS OF ALL NATIONS**, and an Analysis of the Christian, Hebrew, and Mahometan Calendars. Entirely New Edition, revised and considerably enlarged. By W. S. B. WOOLHOUSE, F.R.A.S. [*In the Press.*]
102. **INTEGRAL CALCULUS**, Rudimentary Treatise on the. By HOMERSHAM COX, B.A. Illustrated. 1s.
103. **INTEGRAL CALCULUS**, Examples on the. By JAMES HANN, late of King's College, London. Illustrated. 1s.
101. **DIFFERENTIAL CALCULUS**, Elements of the. By W. S. B. WOOLHOUSE, F.R.A.S., &c. 1s. 6d.
105. **MNEMONICAL LESSONS**.—GEOMETRY, ALGEBRA, AND TRIGONOMETRY, in Easy Mnemonical Lessons. By the Rev. THOMAS PENYNGTON KIRKMAN, M.A. 1s. 6d.
136. **ARITHMETIC**, Rudimentary, for the Use of Schools and Self-Instruction. By JAMES HADDON, M.A. Revised by ABRAHAM ARMAN. 1s. 6d.
137. **A KEY TO HADDON'S RUDIMENTARY ARITHMETIC**. By A. ARMAN. 1s. 6d.
168. **DRAWING AND MEASURING INSTRUMENTS**. Including—I. Instruments employed in Geometrical and Mechanical Drawing, and in the Construction, Copying, and Measurement of Maps and Plans. II. Instruments used for the purposes of Accurate Measurement, and for Arithmetical Computations. By J. F. HEATHER, M.A., late of the Royal Military Academy, Woolwich, Author of "*Descriptive Geometry*," &c., &c. Illustrated. 1s. 6d.
169. **OPTICAL INSTRUMENTS**. Including (more especially) Telescopes, Microscopes, and Apparatus for producing copies of Maps and Plans by Photography. By J. F. HEATHER, M.A. Illustrated. 1s. 6d.
170. **SURVEYING AND ASTRONOMICAL INSTRUMENTS**. Including—I. Instruments Used for Determining the Geometrical Features of a portion of Ground. II. Instruments Employed in Astronomical Observations. By J. F. HEATHER, M.A. Illustrated. 1s. 6d.
- * The above three volumes form an enlargement of the Author's original work, "*Mathematical Instruments: their Construction, Adjustment, Testing, and Use*," the Thirteenth Edition of which is on sale, price 1s. 6d. (See No. 32 in the Series.)
168. } **MATHEMATICAL INSTRUMENTS**. By J. F. HEATHER,
 169. } M.A. Enlarged Edition, for the most part entirely re-written. The 3 Parts as
 170. } above, in One thick Volume. With numerous Illustrations. 4s. 6d. ‡
158. **THE SLIDE RULE, AND HOW TO USE IT**; containing full, easy, and simple Instructions to perform all Business Calculations with unexampled rapidity and accuracy. By CHARLES HOARE, C.E. With a Slide Rule in tuck of cover. 2s. 6d. ‡
185. **THE COMPLETE MEASURER**; setting forth the Measurement of Boards, Glass, &c., &c.; Unequal-sided, Square-sided, Octagonal-sided, Round Timber and Stone, and Standing Timber. With a Table showing the solidity of hewn or eight-sided timber, or of any octagonal-sided column. Compiled for Timber-growers, Merchants, and Surveyors, Stonemasons, Architects, and others. By RICHARD HORTON. Third Edition, with valuable additions. 4s.; strongly bound in leather, 5s.

§ The ‡ indicates that these vols. may be had strongly bound at 6d. extra.

 Arithmetic, Geometry, Mathematics, etc., *continued.*

196. *THEORY OF COMPOUND INTEREST AND ANNUITIES*; with Tables of Logarithms for the more Difficult Computations of Interest, Discount, Annuities, &c. By FÉDOR THOMAN, of the Société Crédit Mobilier, Paris. 4s.†
199. *INTUITIVE CALCULATIONS*; or, Easy and Compendious Methods of Performing the various Arithmetical Operations required in Commercial and Business Transactions; together with Full Explanations of Decimals and Duodecimals, several Useful Tables, and an Examination and Discussion of the best Schemes for a Decimal Coinage. By DANIEL O'GORMAN. Twenty-fifth Edition, corrected and enlarged by J. R. YOUNG, formerly Professor of Mathematics in Belfast College. 3s.†
204. *MATHEMATICAL TABLES*, for Trigonometrical, Astronomical, and Nautical Calculations; to which is prefixed a Treatise on Logarithms. By HENRY LAW, C.E. Together with a Series of Tables for Navigation and Nautical Astronomy. By J. R. YOUNG, formerly Professor of Mathematics in Belfast College. New Edition. 3s. 6d.†

 MISCELLANEOUS VOLUMES.

36. *A DICTIONARY OF TERMS used in ARCHITECTURE, BUILDING, ENGINEERING, MINING, METALLURGY, ARCHÆOLOGY, the FINE ARTS, &c.* By JOHN WEALE. Fifth Edition. Revised by ROBERT HUNT, F.R.S., Keeper of Mining Records. Numerous Illustrations. 5s. cloth limp; 6s. cloth boards.
50. *THE LAW OF CONTRACTS FOR WORKS AND SERVICES.* By DAVID GIBBONS. Third Edition, enlarged. 3s.†
112. *MANUAL OF DOMESTIC MEDICINE.* By R. GOODING, B.A., M.D. Intended as a Family Guide in all Cases of Accident and Emergency. 2s.†
- 112*. *MANAGEMENT OF HEALTH.* A Manual of Home and Personal Hygiene. By the Rev. JAMES BAIRD, B.A. 1s.
150. *LOGIC*, Pure and Applied. By S. H. EMMENS. 1s. 6d.
152. *PRACTICAL HINTS FOR INVESTING MONEY.* With an Explanation of the Mode of Transacting Business on the Stock Exchange. By FRANCIS PLAYFORD, Sworn Broker. 1s. 6d.
153. *SELECTIONS FROM LOCKE'S ESSAYS ON THE HUMAN UNDERSTANDING.* With Notes by S. H. EMMENS. 2s.
154. *GENERAL HINTS TO EMIGRANTS.* Containing Notices of the various Fields for Emigration. With Hints on Preparation for Emigrating, Outfits, &c., &c. With Directions and Recipes useful to the Emigrant. With a Map of the World. 2s.
157. *THE EMIGRANT'S GUIDE TO NATAL.* By ROBERT JAMES MANN, F.R.A.S., F.M.S. Second Edition, carefully corrected to the present Date. Map. 2s.
193. *HANDBOOK OF FIELD FORTIFICATION*, intended for the Guidance of Officers Preparing for Promotion, and especially adapted to the requirements of Beginners. By Major W. W. KNOLLYS, F.R.G.S., 93rd Sutherland Highlanders, &c. With 163 Woodcuts. 3s.†
194. *THE HOUSE MANAGER*: Being a Guide to Housekeeping. Practical Cookery, Pickling and Preserving, Household Work, Dairy Management, the Table and Dessert, Cellarage of Wines, Home-brewing and Wine-making, the Boudoir and Dressing-room, Travelling, Stable Economy, Gardening Operations, &c. By AN OLD HOUSEKEEPER. 3s. 6d.†
194. *HOUSE BOOK (The)*. Comprising:—I. *THE HOUSE MANAGER*. By AN OLD HOUSEKEEPER. II. *DOMESTIC MEDICINE*. By RALPH GOODING, M.D. III. *MANAGEMENT OF HEALTH*. By JAMES BAIRD. In One Vol., & strongly half-bound. 6s.
- 112*.

 The † indicates that these vols. may be had strongly bound at 6d. extra.

 LONDON: CROSBY LOCKWOOD AND CO.,

EDUCATIONAL AND CLASSICAL SERIES.**HISTORY.**

1. **England, Outlines of the History of;** more especially with reference to the Origin and Progress of the English Constitution. By WILLIAM DOUGLAS HAMILTON, F.S.A., of Her Majesty's Public Record Office. 4th Edition, revised. 5s.; cloth boards, 6s.
5. **Greece, Outlines of the History of;** in connection with the Rise of the Arts and Civilization in Europe. By W. DOUGLAS HAMILTON, of University College, London, and EDWARD LEVIEN, M.A., of Balliol College, Oxford. 2s. 6d.; cloth boards, 3s. 6d.
7. **Rome, Outlines of the History of:** from the Earliest Period to the Christian Era and the Commencement of the Decline of the Empire. By EDWARD LEVIEN, of Balliol College, Oxford. Map, 2s. 6d.; cl. bds. 3s. 6d.
9. **Chronology of History, Art, Literature, and Progress,** from the Creation of the World to the Conclusion of the Franco-German War. The Continuation by W. D. HAMILTON, F.S.A. 3s.; cloth boards, 3s. 6d.
50. **Dates and Events in English History,** for the use of Candidates in Public and Private Examinations. By the Rev. E. RAND. 1s.

ENGLISH LANGUAGE AND MISCELLANEOUS.

11. **Grammar of the English Tongue, Spoken and Written.** With an Introduction to the Study of Comparative Philology. By HYDE CLARKE, D.C.L. Fourth Edition. 1s. 6d.
- 11*. **Philology: Handbook of the Comparative Philology of English,** Anglo-Saxon, Frisian, Flemish or Dutch, Low or Platt Dutch, High Dutch or German, Danish, Swedish, Icelandic, Latin, Italian, French, Spanish, and Portuguese Tongues. By HYDE CLARKE, D.C.L. 1s.
12. **Dictionary of the English Language,** as Spoken and Written. Containing above 100,000 Words. By HYDE CLARKE, D.C.L. 3s. 6d.; cloth boards, 4s. 6d.; complete with the GRAMMAR, cloth bds., 5s. 6d.
48. **Composition and Punctuation,** familiarly Explained for those who have neglected the Study of Grammar. By JUSTIN BRENNAN. 17th Edition. 1s. 6d.
49. **Derivative Spelling-Book: Giving the Origin of Every Word** from the Greek, Latin, Saxon, German, Teutonic, Dutch, French, Spanish, and other Languages; with their present Acceptation and Pronunciation. By J. ROWBOTHAM, F.R.A.S. Improved Edition. 1s. 6d.
57. **The Art of Extempore Speaking: Hints for the Pulpit, the Senate, and the Bar.** By M. BAUTAIN, Vicar-General and Professor at the Sorbonne. Translated from the French. 7th Edition, carefully corrected. 2s. 6d.
52. **Mining and Quarrying,** with the Sciences connected therewith. First Book of, for Schools. By J. H. COLLINS, F.G.S., Lecturer to the Miners' Association of Cornwall and Devon. 1s.
53. **Places and Facts in Political and Physical Geography,** for Candidates in Examinations. By the Rev. EDGAR RAND, B.A. 1s.
54. **Analytical Chemistry, Qualitative and Quantitative, a Course of.** To which is prefixed, a Brief Treatise upon Modern Chemical Nomenclature and Notation. By WM. W. PINK and GEORGE E. WEBSTER. 2s.

THE SCHOOL MANAGERS' SERIES OF READING BOOKS,

Adapted to the Requirements of the New Code. Edited by the Rev. A. R. GRANT, Rector of Hitcham, and Honorary Canon of Ely; formerly H.M. Inspector of Schools.

LESSONS FROM THE BIBLE. Part I. Old Testament. 1s.

LESSONS FROM THE BIBLE. Part II. New Testament, to which is added

THE GEOGRAPHY OF THE BIBLE, for very young Children. By E. THORNTON FORSTER. 1s. 2d. * * Or the Two Parts in One Volume.

FRENCH.

24. **French Grammar.** With Complete and Concise Rules on the Genders of French Nouns. By G. L. STRAUSS, Ph.D. 1s. 6d.
25. **French-English Dictionary.** Comprising a large number of New Terms used in Engineering, Mining, &c. By ALFRED ELWES. 1s. 6d.
26. **English-French Dictionary.** By ALFRED ELWES. 2s.
- 25,26. **French Dictionary** (as above). Complete, in One Vol., 3s.; cloth boards, 3s. 6d. *.* Or with the GRAMMAR, cloth boards, 4s. 6d.
47. **French and English Phrase Book:** containing Introductory Lessons, with Translations, several Vocabularies of Words, a Collection of suitable Phrases, and Easy Familiar Dialogues. 1s. 6d.

GERMAN.

39. **German Grammar.** Adapted for English Students, from Heyse's Theoretical and Practical Grammar, by Dr. G. L. STRAUSS. 1s.
40. **German Reader:** A Series of Extracts, carefully culled from the most approved Authors of Germany; with Notes, Philological and Explanatory. By G. L. STRAUSS, Ph.D. 1s.
41. **German Trilogot Dictionary.** By NICHOLAS ESTERHAZY S. A. HAMILTON. Part I. English-German-French. 1s.
42. **German Trilogot Dictionary.** Part II. German-French-English. 1s.
43. **German Trilogot Dictionary.** Part III. French-German-English. 1s.
- 41-43. **German Trilogot Dictionary** (as above), in One Vol., 3s.; cloth boards, 4s. *.* Or with the GERMAN GRAMMAR, cloth boards, 5s.

ITALIAN.

27. **Italian Grammar,** arranged in Twenty Lessons, with a Course of Exercises. By ALFRED ELWES. 1s. 6d.
28. **Italian Trilogot Dictionary,** wherein the Genders of all the Italian and French Nouns are carefully noted down. By ALFRED ELWES. Vol. 1. Italian-English-French. 2s. 6d.
30. **Italian Trilogot Dictionary.** By A. ELWES. Vol. 2. English-French-Italian. 2s. 6d.
32. **Italian Trilogot Dictionary.** By ALFRED ELWES. Vol. 3. French-Italian-English. 2s. 6d.
- 28,30. **Italian Trilogot Dictionary** (as above). In One Vol., 7s. 6d. Cloth boards.

SPANISH AND PORTUGUESE.

34. **Spanish Grammar,** in a Simple and Practical Form. With a Course of Exercises. By ALFRED ELWES. 1s. 6d.
35. **Spanish-English and English-Spanish Dictionary.** Including a large number of Technical Terms used in Mining, Engineering, &c., with the proper Accents and the Gender of every Noun. By ALFRED ELWES. 4s.; cloth boards, 5s. *.* Or with the GRAMMAR, cloth boards, 6s.
55. **Portuguese Grammar,** in a Simple and Practical Form. With a Course of Exercises. By ALFRED ELWES. 1s. 6d.
56. **Portuguese-English and English-Portuguese Dictionary,** with the Genders of each Noun. By ALFRED ELWES.

[In preparation.]

HEBREW.

- 46*. **Hebrew Grammar.** By Dr. BRESSLAU. 1s. 6d.
44. **Hebrew and English Dictionary,** Biblical and Rabbinical; containing the Hebrew and Chaldee Roots of the Old Testament Post-Rabbinical Writings. By Dr. BRESSLAU. 6s. *.* Or with the GRAMMAR, 7s.
46. **English and Hebrew Dictionary.** By Dr. BRESSLAU. 3s.
- 44,46. **Hebrew Dictionary** (as above), in Two Vols., complete, with 46*. the GRAMMAR, cloth boards, 12s.

LONDON: CROSBY LOCKWOOD AND CO.,

LATIN.

19. **Latin Grammar.** Containing the Inflections and Elementary Principles of Translation and Construction. By the Rev. THOMAS GOODWIN, M.A., Head Master of the Greenwich Proprietary School. 1s.
20. **Latin-English Dictionary.** By the Rev. THOMAS GOODWIN, M.A. 2s.
22. **English-Latin Dictionary;** together with an Appendix of French and Italian Words which have their origin from the Latin. By the Rev. THOMAS GOODWIN, M.A. 1s. 6d.
- 20, 22. **Latin Dictionary** (as above). Complete in One Vol., 3s. 6d.; cloth boards, 4s. 6d. * * Or with the GRAMMAR, cloth boards, 5s. 6d.

LATIN CLASSICS. With Explanatory Notes in English.

1. **Latin Delectus.** Containing Extracts from Classical Authors, with Genealogical Vocabularies and Explanatory Notes, by H. YOUNG. 1s.
2. **Cæsar's Commentarii de Bello Gallico.** Notes, and a Geographical Register for the Use of Schools, by H. YOUNG. 2s.
3. **Cornelius Nepos.** With Notes. By H. YOUNG. 1s.
4. **Virgilii Maronis Bucolica et Georgica.** With Notes on the Bucolics by W. RUSHTON, M.A., and on the Georgics by H. YOUNG. 1s. 6d.
5. **Virgilii Maronis Æneis.** With Notes, Critical and Explanatory, by H. YOUNG. New Edition, revised and improved. With copious Additional Notes by Rev. T. H. L. LEARY, D.C.L., formerly Scholar of Brasenose College, Oxford. 3s.
- 5* ——— Part 1. Books i.—vi., 1s. 6d.
- 5** ——— Part 2. Books vii.—xii., 2s.
6. **Horace; Odes, Epode, and Carmen Sæculare.** Notes by H. YOUNG. 1s. 6d.
7. **Horace; Satires, Epistles, and Ars Poetica.** Notes by W. BROWN-RIGG SMITH, M.A., F.R.G.S. 1s. 6d.
8. **Sallustii Crispi Catalina et Bellum Jugurthinum.** Notes, Critical and Explanatory, by W. M. DONNE, B.A., Trin. Coll., Cam. 1s. 6d.
9. **Terentii Andria et Heautontimorumenos.** With Notes, Critical and Explanatory, by the Rev. JAMES DAVIES, M.A. 1s. 6d.
10. **Terentii Adelphi, Hecyra, Phormio.** Edited, with Notes, Critical and Explanatory, by the Rev. JAMES DAVIES, M.A. 2s.
11. **Terentii Eunuchus, Comœdia.** Notes, by Rev. J. DAVIES, M.A. 1s. 6d.
12. **Ciceronis Oratio pro Sexto Roscio Amerino.** Edited, with an Introduction, Analysis, and Notes, Explanatory and Critical, by the Rev. JAMES DAVIES, M.A. 1s.
13. **Ciceronis Orationes in Catilinam, Verrem, et pro Archia.** With Introduction, Analysis, and Notes, Explanatory and Critical, by Rev. T. H. L. LEARY, D.C.L. formerly Scholar of Brasenose College, Oxford. 1s. 6d.
14. **Ciceronis Cato Major, Lælius, Brutus, sive de Senectute, de Amicitia, de Claris Oratoribus Dialogi.** With Notes by W. BROWN-RIGG SMITH, M.A., F.R.G.S. 2s.
16. **Livy: History of Rome.** Notes by H. YOUNG and W. B. SMITH, M.A. Part 1. Books i., ii., 1s. 6d.
- 16* ——— Part 2. Books iii., iv., v., 1s. 6d.
17. ——— Part 3. Books xxi., xxii., 1s. 6d.
19. **Latin Verse Selections,** from Catullus, Tibullus, Propertius, and Ovid. Notes by W. B. DONNE, M.A., Trinity College, Cambridge. 2s.
20. **Latin Prose Selections,** from Varro, Columella, Vitruvius, Seneca, Quintilian, Florus, Velleius Paterculus, Valerius Maximus, Suetonius, Apuleius, &c. Notes by W. B. DONNE, M.A. 2s.
21. **Juvenalis Satiræ.** With Prolegomena and Notes by T. H. ESCOTT, B.A., Lecturer on Logic at King's College, London. 2s.

GREEK.

14. **Greek Grammar**, in accordance with the Principles and Philological Researches of the most eminent Scholars of our own day. By **HAMILTON**. 1s. 6d.
- 15, 17. **Greek Lexicon**. Containing all the Words in General Use, with their Significations, Inflections, and Doubtful Quantities. By **HENRY R. HAMILTON**. Vol. 1. Greek-English, 2s. 6d.; Vol. 2. English-Greek, 2s. Or the Two Vols. in One, 4s. 6d.: cloth boards, 5s.
- 14, 15. **Greek Lexicon** (as above). Complete, with the **GRAMMAR**, in 17. One Vol., cloth boards, 6s.

GREEK CLASSICS. With Explanatory Notes in English.

1. **Greek Delectus**. Containing Extracts from Classical Authors, with Genealogical Vocabularies and Explanatory Notes, by **H. YOUNG**. New Edition, with an improved and enlarged Supplementary Vocabulary, by **JOHN HUTCHINSON, M.A.**, of the High School, Glasgow. 1s. 6d.
- 2, 3. **Xenophon's Anabasis**; or, The Retreat of the Ten Thousand. Notes and a Geographical Register, by **H. YOUNG**. Part 1. Books i. to iii., 1s. Part 2. Books iv. to vii., 1s.
4. **Lucian's Select Dialogues**. The Text carefully revised, with Grammatical and Explanatory Notes, by **H. YOUNG**. 1s. 6d.
- 5-12. **Homer, The Works of**. According to the Text of **BARUMLEIN**. With Notes, Critical and Explanatory, drawn from the best and latest Authorities, with Preliminary Observations and Appendices, by **T. H. L. LEARY, M.A., D.C.L.**
- | | | |
